The resilience of employment in the Culture and Creative Sectors (CCIs) during the crisis

by Giulio Stumpo, Robert Manchin

EENC Report, August 2014

Final report
This document has been prepared by Giulio Stumpo, and revised by Robert Manchin on behalf of the European Expert Network on Culture (EENC). Research support has been provided by Elena Alessandrini, Flaminia Piedimonte and Federica Torsello.

This paper reflects the views only of the EENC authors and the European Commission cannot be held responsible for any use which may be made of the information contained therein.

About the authors

Giulio Stumpo is specialized in economic analysis and evaluation of culture and creativity. Since 2004 he is advisor to the Italian Observatory of the performing arts of the Italian Ministry of Cultural Heritage. He is an associate of Eccom – European Centre for Cultural Organisation and Management and of the "Associazione per l'Economia della Cultura". He also is advisor of public and private, profit and not-for-profit organizations in the cultural and creative sector. From 2008 he is head of Eccom Progetti s.r.l. In 2013 he founded and was named CEO of SMartIt (Società Mutualistica per Artisti). He is specialised in the elaboration and implementation of cultural projects, and also carries out statistical and economic analyses in the fields of the performing arts and of cultural tourism and social investments. He teaches "Economics of local autonomy" at the University of L'Aquila and "Economics of the Arts and Culture" in many post-graduate courses. From 2000 he is member of the Banca Popolare Etica, an Italian ethic bank, specialized in financing the third sector and social economy; he advises on the socio-environmental evaluation of the bank’s investments. He is also consultant for international projects: “Promoción del turismo de las misiones en el Mundo guaraní” – Banco Interamericano de Desarrollo – International Development Bank– Target Euro – Paraguay, and “Technical assistance to the Minister of Culture for the implementation of the restoration laboratori in the National Museum of Belgrade and for the realisation of the central Institute for Restoration in Serbian Republic” – Minister of Foreign Affair – DG Italian Cooperation for development – Belgrade. He was part of the team involved in the research “Sustainable Financing Mechanisms for Cultural Investments, Institutions, and Activities”, ICARE - International Center for Arts Economics Venezia e World Bank Organisation Washington, D.C., USA. Italian is his mother tongue; he is fluent in English.

Robert Manchin is as social scientist, economist, professor and lecturer. He is the Chairman and Managing Director of Gallup Europe and has been conducting empirical social research for the last 40 years, initially as a researcher at the Hungarian Academy of Sciences, and in the last 20 years at Gallup in the USA and in Europe. A Professor at the College of Europe, Brugge, Belgium, he is involved in a number of graduate university programmes in Europe. He has worked on the Eurobarometer Candidate Countries for the European Commission (EC) and in the last 4 years, the EC’s Flash Eurobarometer, Europe’s largest on-going measurement project, serving the information needs of Europe’s public policymakers. He also directed various large-scale surveys on wellbeing in Europe, the last 2 European Working Condition Surveys for Eurofound, the EU-wide MIDI Survey of immigrant and ethnic minority groups’ experiences on discrimination and victimisation for the Fundamental Rights Agency, among others. He initiated and continues to lead the Gallup Balkan Monitor and is in charge of the European part of the largest ongoing survey on behavioural economics study on wellbeing of the Gallup World Poll and Soul of the City. He is a specialist in: social audits for the public sector, including local and regional government administrations, school-systems, health; research programs monitoring economic expectations, political, and social trends; data and survey-based information on governance issues; performance indicators for the quality of education, healthcare, and other public services; the use of micro-data for policy decision and social impact studies; the use of data and survey-based information creating performance indicators for the quality of educational, health and various other public services. He holds a degree in Economics from the Karl Marx University of Economics, Budapest, Hungary; in Music from the Liszt Ferenc Academy of Music, Budapest, Hungary; and in Sociology from MacMaster University, Ontario, Canada. In 2006, Robert was elected as Deputy Mayor of Vallaquis, Hungary. Since 1994, he runs the Foundation Europa Nova, promoting social innovations in local scale in Hungary and Croatia. He also is a Trustee of the Brussels-based think-tank “Friends of Europe.” Hungarian is his mother tongue; he is fluent in English.
Executive Summary

The present EENC study present a thorough review and analysis of the best available statistical evidence regarding employment in the various local labour markets in the 28 EU Member States. As shown throughout, there is indeed evidence that the Culture and Creative Sectors (CCIs) have proven to provide a certain degree of resilience during times of economic crisis in Europe. However, the rich data presented in the country by country summaries suggest that the sector is not immune from the state of the overall policy responses of the given governments.

It was possible to collect and analyse all publicly available summary information on employment in the CCIs (especially on youth employment). From the available aggregate information (both in terms of primary statistical sources and in terms of previous policy studies on the subject) strong indications were found of comparative resilience during the crisis in different EU Member States.

The labour–intensive character of the CCIs, notably in relation to youth employment can act as a flexible buffer zone in the special labour market characterizing the sector. What emerges is a new policy environment in the aftermath of the crisis. Any overall policy should consider that the CCI sector is divided in terms of characteristics of the jobs it can offer to segments that are governed by different logics. On the one hand, it has a subsector that is very sensitive to the availability of public sector funding and to the shifts in cultural policy priorities in the different EU Member States. Trend-lines presented in the country by county profiles, demonstrate clearly that long term job security in time of contraction of cultural budgets are much harder to come by for those young professionals who are entering the cultural labour market in this segment. The high turnover in limited ad hoc positions are not unique to this sector –high unemployment rates among the young cohort is similar to the situation in other professional service sector jobs, but without special policy considerations for the most creative cohort, it can cause a permanent dent on the performance of this subsector of the CCIs.

At the same time, the mostly private innovative sector that characterizes the other dominant segment of the CCIs, as demonstrated with data, is undergoing a rapid change. Professionals, especially young professionals working in occupational categories that cover ICT related jobs, are not just resilient to the crisis; indeed, in most countries these job opportunities are expanding in a more dynamic fashion than happens for the rest of the economy. A new cross-section of ICTs and creative design and digital media related app-economy is emerging in some of the most dynamic creative clusters in various European regions. A preliminary projection of jobs and growth in the CCIs in this particular segment is positive, notably for those young creative professionals who prefer to work on a dynamic, less formal job market.

As shown throughout the study the work force employed in the CCIs represents a very small part of the total work force: indeed, those employed in the CCIs represent approximately 2% of the total work force. The Labour Force Survey (LFS) is carried out through a sample of the total work force and, although the resulting trends can be considered as general, when specific segments of data (be it per country or sector) are analysed trends appear as less significant. Consequently, when alterations happen on small numbers and are applied to percentages they appear to be more relevant than what they should.

As most studies show, women represent the highest percentage of those employed in the cultural sector, in general, but also in the CCIs. When the “resilience” factor appears in
employment, the obvious question is whether it is the sector, be it the cultural sector of the CCIs, which is resilient or whether it is rather women that, in more general terms, are more resilient.

Most of those employed in the CCIs are either employed in small companies (SMEs) or self-employed. When analysing self-employment it appears that it covers a very wide diversity of professions, ranging from culture and the arts to amusement activities, betting and gambling or sport. Therefore, available data does not allow for a correct identification of trends as regards in self-employment in the CCIs.

The different European countries show diverse situations which make it difficult to compare larger countries such as Germany, France or Italy with smaller ones such as Estonia, Luxemburg, Malta, etc. Moreover, in some cases the overall population of a one given country is lower than that of regions or cities in another: for example, the total population of Croatia is equivalent to 50% of the population of London. Thus, analysis should be eventually carried out at different territorial levels, depending on the situation.

In fact, in some cases the analysis of the CCIs appears to be better focused if carried out within smaller territories rather than at country level especially in the cases of larger countries where it is difficult to identify micro data and, consequently, identify development trends.

Public policies geared to foster culture and creativity have a stronger impact sub-national level, in a limited number of regions (as is the case of the creative clusters). Although this study provides for a macro analysis it, nevertheless, enables for the identification of the criteria to determine what are the most relevant environments where culture and creativity can flourish.

A new analysis of the 2014 Regional Innovation Scoreboard, while looking in a wider context provides further evidence that the intra-country differences in terms of concentration of the ICT sector and related jobs are much higher than other areas. The high correlation of the CCI with the most innovative sectors of the economy suggest that localized interventions that are geared to the unique contexts of these labour markets need to be considered when promoting the cultural job market as well.

As stated on several occasions in the study, culture and creativity flourish in territorial "clusters" albeit in specific countries. Conversely, these clusters have direct or indirect spillover effects on other sectors, industrial or not, and also beyond the specific territory where they are located. This shows that although this study has applied the "from general to particular" approach, the reverse approach might prove to provide interesting results.

In a period when public and private budgets decrease it is important that public policies aim at fostering both cultural participation and consumption of cultural goods and services in order to boost the development of the cultural and creative sectors through direct market revenue.

Finally, regulating the labour markets can have a strong impact on the development of the cultural and creative sectors.
Therefore there is further scope to:

• Identify creative clusters where to carry out specific research in order to provide policy makers with a more detailed dimension of the phenomenon. In this sense, it might be interesting to focus research on medium-sized cities (or on specific areas of larger-sized cities).

• Include social indicators in the analysis of the cultural and creative sectors since they provide for a good approximation to the creative environment.

• Collect, in the coming years, a data set to track the development of the cultural and creative sectors and emphasize the different development trends at different territorial levels.

• Make available both quality open-data in the cultural and creative sectors as well as the existing research on the impact of cultural and creative policies since this provides very useful tools for all those professionals wanting to operate in the sector.

• Stimulate transparency as regards public funding, both at national and local levels, for the cultural and creative sectors not only as concerns its end-results but, rather, as regards the overall process leading to the granting of funds. This enables for a sense of ownership built on trust from the cultural professionals as well as from civil society at large. Ultimately, it fosters the development of the sector itself.

• Identify, in detail, the parameters and categories that define both cultural and creative professionals as well as the cultural and creative sectors.
Foreword

On April 10 2014, the Directorate General for Education and Culture of the European Commission - Unit E1 (DG EAC/UNIT E1) submitted to the European Expert Network on Culture (EENC) a “Request for a study on the resilience of employment in the Culture and Creative Sectors (CCIs) during the crisis, the percentage of youth employment in the CCCs, and the projections of employment and growth of the CCCs notably in the digital environment” submitted by in 2014, April the 10th.

On the basis of the brief enclosed to the request, the EENC developed a proposal to carry out a study in the 28 European Member States that consists in collecting and analysing public data in the field of culture, creativity and new technologies with the following aims:

✔ To present statistical and policy evidence supporting the assumption that employment in the Culture and Creative Sectors (CCIs) has proven to provide for a certain degree of resilience during the years of the financial crisis in Europe.

And in particular as follows:

✔ A summary of updated information on the employment in the CCIs (notably youth employment) and its comparative resilience during the crisis in different Member States taken from existing bibliography and available statistics (among others, from Eurostat);

✔ A set of comparative examples highlighting the labour-intensive character of CCIs, notably in relation to youth employment;

✔ A preliminary projection of jobs and growth in the CCIs notably for the young.

To this end a data base collecting data available from public statistical institutions, especially from Eurostat, has been set up.

The data base, attached in digital format, can be exploited for a short comparison of the data available in the 28 Member States and can be queried for different topics.

Methodology

To correctly define the analysis it is important to understand the borders. The request of DG EAC UNIT E1 presents different questions discussed in this paragraph and that are essential to the comprehension of the results and the data analysis.

Classification

The international debate on what creative industries are starts with a document published by the UK Department for Culture Media and Sport (DCMS) called “Creative industries mapping document” in 1998.

After this pioneer document a lot of studies were carried out to better define the sector and to analyse the contribution of intangible assets as “culture” and “creativity” to the whole economy.
Among others, one of the wider classifications was elaborated by UNCTAD (United Nations Conference on Trade and Development) and is summarized in the following figure:

**Figure 1. The UNCTAD classification of Creative Industries**

Source: elaboration by UNCTAD

Focusing on this classification, the most relevant consideration is that there is a very wide range of “sectors” and activities that can be considered as “creative”: from the arts and antiquities to the “creative services” or the production of videogames and toys.

The question about which are to be considered as “creative professionals” is not an easy one to answer. Indeed, studies that address the issue of creative professionals and of employment in the creative sector, consider as “creative” many different types of professions. In general terms, all those that work with intellectual sources can be considered as “creative professionals”. The term thus encompasses very diverse professions, ranging from actors, dancers, archaeologists and designers to lawyers or other intellectual professionals.

Therefore, and in accordance with the DG EAC, it was decided that for the scope of the study the legal basis of the “Creative Europe” program would be used by which “cultural and creative sectors” englobe “all sectors whose activities are based on cultural values and/or artistic and other creative expressions, whether those activities are market- or non-market-oriented, whatever the type of structure that carries them out, and irrespective of how that structure is financed. Those activities include the development, the creation, the production, the dissemination and the preservation of goods and services which embody cultural, artistic or other creative expressions, as well as related functions such as education or management. The cultural and creative sectors include inter alia architecture, archives, libraries and museums, artistic crafts, audio-visual (including film, television, video games
and multimedia), tangible and intangible cultural heritage, design, festivals, music, literature, performing arts, publishing, radio and visual arts”.

Nevertheless, in addition to this wide classification and in order to include ICTs the study has also taken into consideration other parameters to describe employment and future job opportunities for this sector.

**Comparability**

Another point of discussion is the data comparability. In this respect we decided to use data mainly published by official sources:

To avoid the risk of different methodologies of collection and elaboration of data we choose the most complete data set for the different parameters taken into consideration.

The study carried out a desk research: data collected are available in the official sources. Following many economists and researches, Culture and creativity can develop a strong impact on the economies, especially in Europe. Culture and Creativity can have different impacts that can be described twice: a direct impact and an indirect impact.

The direct impact can be represented by many economic and social indicators (GDP in CCIs, Employment in CCIs et.); the indirect impact is often difficult to calculate due to the difficulty in the computation of externalities.

This second aspect is very important because the most powerful impact of culture and creativity is considered an externality.

The experience of cultural consumption can be measured by the price of a book, the number of tickets sold, or other indicators (economic or not), in this way we would lose a lot of relevant information.

This is the reason why the data collected are not always directly connected with the core of the study but we want to give a wider range of parameters to better understand the different situations in each country and to understand the different policies needed at the European, National and local level.

**Young people**

To define young people in the “liquid society” is not easy. In general we can say that in many studies the 15-24 year olds are considered young, because of the years spent in school. In some countries, those younger than 35 are considered “young people”.

For this reasons the age class are standardized and we take in consideration people between 15 and 24 and, when are available, between 15 and 29.

**Crisis**

On September 15, 2008 one of the most important international banks, Lehman Brothers, declared to have filed for Chapter 11 - bankruptcy protection. This is considered to be the official starting date of the last financial crisis that has become, in the following years, a deep economic crisis in the Euro-American area. Europe is affected by a period of stagnation that
is more than a financial crisis and in this context it is difficult to understand whether the financial situation is a cause or an effect of a much deeper crisis, both economic and social.

What we have learned over the last few years is that the debate on economic growth and development is strictly connected with the social environment and that competitiveness is often part of an obsolete vocabulary that should be partially modified.

In this context, and in agreement with the DG EAC, it was decided to focus the research on data for the years between 2007 and 2013 (for the latter, when available).

As for the definition of the economic context, it was decided to collect figures for the following general items:
- GDP,
- GDP per capita,
- employment,
- employment in the creative sector,
- total labour force,
- total labour force in the creative sector,
- % of the creative GDP in the CCS’s.

After a thorough analysis of the sources available the field under analysis has been widened and the number of indicators has been increased.

As regards the latter and with the aim of taking into consideration not only economic and social indicators, it was decided to also include the so-called “trust indicators”. This choice stems from the consideration that culture and the creative sector are better developed, or have a good chance of development, in regions and countries in which the quality of social relations is strong. It is two-way relation, both as a condition and also as one of the most important social outcomes: “trust indicators” can give an idea of the context for each country and can describe the environment where CCIs are developed.

Other indicators that have been included are:
- female participation as a proxy measure to understand the quality of social inclusion;
- data on crime or participation to social life as another proxy measure of social cohesion;
- sectorial data in order to analyse in depth the cultural and creative sector.

The study has applied the following methodology:

**Mapping of relevant literature.**

To carry out this study a preliminary desk research identified policy documents, research reports, comparative research frameworks (e.g. the Compendium on Cultural Policies and Trends in Europe), articles and other written evidence relevant for the subject matter. All documents are collected and available in digital format.

**Economic analysis.**

Existing data in literature and in public statistics (Eurostat, Compendium on cultural policies, etc.) were collected and analysed. All the collected data were combined with the range of other variables, as those listed above (e.g. GDP per capita, employment, etc.), in order to analyse the trends in employment in the CCIs in the years under study. When possible, longer-term trends were outlined.
Analysis of national evidence.

Based on the available data short national profiles of the 28 EU Member States have been produced. In order to complete the profiles, and in agreement with DG EAC, some online interviews with experts were carried out, including national experts in the field under study.

Best (and worst) practices in the field of employment policies in the CCIs.

The research has not provided elements for interesting practices, implemented either at national or regional level, to boost and support employment in the CCIs.

The European scenario

Trends in Europe

In the next pages general data are analysed to better understand the overall, general environment in Europe. To allow for a better comparison between data shown in this section and data shown in the following it was decided to set the year 2008 as the base-years. This for two reasons: the first is that the data concerning the CCIs are available only as of 2008; the second is that the economic and financial crisis started in 2007 and that the trends started to show a decrease from 2008.

The first data shown regards European population: while the total population has grown in the past 10 years about 3.4%, for the same period young population\(^1\) has decreased about 8%.

Data confirms the general trend of ageing in Europe (figure 2).

![Figure 2. Trends of population and young population in Europe (2008=100)](image)

Source: Eurostat, own elaboration on Eurostat data

The financial crisis that started in 2007 has had a very strong impact on the general economy indicators. The figure above (figure 3) shows the trends of the Gross Domestic Products at market prices and for inhabitants in the period between 2003 and 2013. The worst period was between 2008 and 2010 and, after 2011, GDP started to grow again albeit

\(^1\) Eurostat defines as “young population” those aged between 15 and 29; for the scope of this study the “young population” is the one aged 15 to 24: to this end data has been cleared of information regarding those aged 26 to 29.
at a lower rate. Because of the population growth in the same period, GDP per inhabitant grows less than the general figures.

The figure below (figure 4) shows the trend in public expenditure in the last ten years: from 2008 the increase of public expenditure is not as fast as before due to the financial crisis that affected the public sector and the growing of national public debts.

Figure 4. Trend in public expenditure in Europe (2008=100)

Source: Eurostat

Following the trend of the population, the labour force in the 10 years in question has diminished: Figure 5 shows that total labour force is growing but this is not true for young people.

In general young Europeans face facing a very deep crisis. The following figure shows the trends of employed and self-employed for different age categories: while the employed and self-employed from 25 years old remain at about the same level of 2008, young employed and self-employed are decreasing very strongly in the last 5 years (figure 6).

Figure 6. Trend in employment in Europe (2008=100)

Source: Eurostat

In general this figure shows that, at the same age, the self-employed have a better resilience as compared to those that are employed.

The cultural and creative sector

The cultural and creative sector is usually subsidized through public funding. The following figure shows the trend in public funding in Europe using the following COFOG nomenclature:

- Broadcasting and publishing services
- Cultural services
As the figure below shows, from 2003 to 2008 public expenditure in culture and creativity at market price registered an increase; whereas, from 2008 to 2012 (the last year available) it decreased slightly of about 5% (figure 7). When public funding decreases private funding also shows the same trend. In general terms, funding for culture and creativity has registered a slight decrease, especially from 2007.

Figure 7. Public expenditure in culture and creativity in Europe (2008=100)

Source: Eurostat

To delimit the cultural and creative sector for the scope of this study, where possible, NACE codes with 3 digits were used. The following are the codes selected to this end:

- **J) Information and communication**
  - 58 Publishing activities
  - 59 Motion picture, video and television program production, sound recording and music publishing activities
  - 60 Programming and broadcasting activities

- **R) Arts, entertainment and recreation**
  - 90 Creative, arts and entertainment activities
  - 91 Libraries, archives, museums and other cultural activities

When available, the figures also show the second level of classification. Nevertheless, for the self-employed this second level of classification is not possible given that data are only available for the general level through the following codes:

- **J) information and communication**
  - 61 Telecommunications
  - 62 Computer programming, consultancy and related activities
  - 63 Information service activities

- **R) Arts, entertainment and recreation**
  - 92 Gambling and betting activities
  - 93 Sports activities and amusement and recreation activities

As regards employment in the CCIs the NACE codes R58, R59, R60, J90 and J91 have been used and, as regards the ICTs, data from NACE J61, J62 and J63 have been used.
As Figure 10 shows, while the employed and self-employed suffer from the crisis, those that work in the cultural and creative sectors face a better situation especially as regards the self-employed in the “Information and communication” sectors but also those in the “Arts, entertainment and recreation”.

A similar consideration can be done as regards the employed: since the cultural and creative sectors show a growing, albeit cautious, trend they are in a better situation with respect to those employed in other sectors.

Nevertheless, the last year (2013) shows a changing situation insofar as the “Information and communication” sector registers a loss of employed and self-employed.

Similar considerations can be done as regards young people: those that are self-employed seem to be more resilient than those that are employed. Moreover, those working under a self-employment regime in the cultural and creative sector appear to be better positioned than their colleagues working in other sectors. Nevertheless, it must be pointed out that this is not true for the employed that work in “Information and communication” that register the worst situation at the end of the period.

As shown above, the cultural and creative sector is better described by using the second level of NACE coding but the analysis of employment situations is possible only for the employed and not for the self-employed.
The following figure illustrates the trend for workers in CCIs. While the employed in the cultural and creative sector show a resistance after the crisis and their performance is better than the general trend, for young people this trend is not respected. Those ones working in the CCIs fare less well than their older colleagues (figure 12).

**Figure 12. Trend in Employment in CCIs in Europe per age (2008=100)**

Source: Eurostat

The following figure shows the trend for young people in every sector (figure 13) and, when compared to the overall employment situation of the adult labour force (figure 14), enables for a detailed analysis of the trend depicted above.

**Figure 13. Trend in Employment for young people in Europe (2008=100)**

**Figure 14. Trend in Employment for adult people in Europe (2008=100)**

Source: Eurostat

For instance, in the 6 years analysed (2008-2013) employment of young people in “Publishing activities” (NACE J 58) shows a very strong decrease, falling of about 40%; and employment in “Creative, arts and entertainment activities” (NACE R 90) registers a better overall performance although it shows a loss of about 15% of employed throughout the period.

A significant growth is registered in employment in “Libraries, archives, museums and other cultural activities” (NACE R 91) where, at the end of the period, there is a growth of more than 3%. This is also the case for employment in “Motion picture, video and television program production, sound recording and music publishing activities” (NACE J 59). Both sectors indeed register a fluctuating trend in the last two years analysed. A more stable growth trend is registered as regards the employed in “Programming and broadcasting activities” with an increase of 13%.
Figure 14 shows the trend followed by employed adults. In the CCIs a negative performance is registered only for those employed in “Publishing activities” (NACE J 58). All other sectors register a growing trend: for the “Creative, arts and entertainment activities” (NACE R 90) +3,9%; for “Motion picture, video and television program production, sound recording and music publishing activities” (NACE R 59) +6,1%; for “Programming and broadcasting activities” (NACE R 60) +15,3%.

ICT and technologies

The analysis of the situation as regards the ICTs has been done by collecting data from Eurostat, using indicators in the sector and data on employment in 3 NACE sectors.

The indicators chosen are: the number of fixed telephone subscriptions per 100 inhabitants; the number of mobile subscriptions per 100 inhabitants; the number of fixed and wired subscriptions per 100 inhabitants and the percentage of individuals that use the Internet.

To analyse employment data was collected from Eurostat for the following sectors:

- J) information and communication
  - 61 Telecommunications
  - 62 Computer programming, consultancy and related activities
  - 63 Information service activities

The following figure shows the average indicators in Europe as regards equipment and use of new technologies (figure 15).

As of 2003, fixed telephone subscriptions decrease, in average, an 8% while mobile subscriptions rise in average 49,4%. As regards broadband it reaches 26,8% in 2013, whereas it was at 4,6% in 2003. The number of persons using the Internet reached an average of 75,2% in 2003 starting from 40% in 2003 (figure 16).

The following figures show the general trend of employment in ICT in European countries (figures 17 and 18). The average growth of employment in the ICT is the result of the growth of employment in “Computer programming” (NACE 62) which drives the growth of the sector as a whole; in fact, they represent 1.3% of the total employed and the highest number of those employed in the ICTs. A positive trend is registered as regards those employed in the “Information services” (NACE 63) although they represent only 0,2% of the overall employed. The only sector that shows a negative trend is that of “Telecommunications” (NACE 61) that loses 21,3% of employed, from 2008 onwards.
Comparison between European countries

Before analysing every individual country, this paragraph highlights the main differences existing between European countries through a brief comparison of selected 5 main indicators:

- Public expenditure in culture on General public expenditure
- Participation in cultural life
- Employment in CCIs on general employment
- Individuals using the Internet
- Contribution of ICTs to GDP
- Employment in ICTs on general employment

The following tables show the main indicators for each country (tables 1) and the countries’ position as regards the main indicators (table 2):

- ✓ the country with the highest number of employed in the CCIs is Estonia (2.77 per 100 employed), the one with the lowest is Romania (0.7 per 100 employed);
- ✓ the country with the highest number of employed in the ICTs is Sweden (2.97 per 100 employed), the one with the lowest Romania (1.15 per 100 employed);
- ✓ the country with the highest public expenditure in culture is the Czech Republic with 7.8% of general public expenditure whereas Greece is the country with the lowest (1.9%);
- ✓ the country with the highest participation in cultural life is Finland (59.8%) and the one with the lowest is Bulgaria (12.2%);
- ✓ the country where the Internet has the highest rate of penetration is Sweden (87.8%) and the one with the least is Romania (24.7%).

Country profiles

Many international studies underline that the “Creative economy” is the result of policies in different segments of public policies and that the factors that illustrate the development of creativity can be different depending on the country due to the different existing situations, traditions, income and skills levels, etc.

In order to offer a quick classification of the different starting points for the 28 EU Member States included in the study, data from different sources has been collected with the aim of giving a brief overview for each country. In particular, data has been collected as regards the supply side in culture, the demand for cultural goods and services, the employment situation in every country; as already indicated indicators on trust have also been included.

Information included in each country profile is structured in the following sections:

- General information;
- Social environment;
- Culture and Creativity;
- Demand and Supply of Culture and Creativity;
- Education;
- Employment and young employment;
- Information and Communication Technologies.

AUSTRIA

Austria is a country with about 8,5 million inhabitants and has been a member of European Union since 1995. In the last 10 years, population has registered a slight growth of about 4,2%. The young are over 1 million and after a first 5 year growth cycle, as of 2008 the situation is stable.

![Figure 19. Trend in population in Austria](image)

![Figure 20. Trend in labour force in Austria](image)

Source: Eurostat

The following figures show the trend in Gross Domestic Product and general government expenditure. The Austrian government faced the crisis period using public expenditure to balance the effect of the economic depression. After 2009, GDP and GDP per capita started again to grow as did the general public expenditure albeit at a lower rate. One of the effects of the crisis has been an increase in the difference between the poor and the rich populations: in fact Figure 21 shows that GDP has grown at a faster rate than GDP per capita.
Although in general terms the crisis has not much affected the country, the following figure shows that the young employed have instead suffered severely from the crisis: total employment registered a growth of 2,1% while the employed between 15 and 24 years registered a loss of 4% in 5 years (figure 23). The following figure also shows the fluctuation of the young self-employed. In this case raw data on self-employment are probably not collected in the same way as for employment. Anyhow, it appears that the general trend for the young Austrian people is to switch from an employment to a self-employment situation.

In general, after 2008 employment and self-employment registered a slight growth of about 2%.

Social environment
The cultural and creative sectors are developed in countries, especially in towns, where there is a strong attitude of openness and tolerance towards diversity. This is the reason why this section shows data on women’s participation in the labour market and also includes a few “trust” indicators that can give a dimension of the openness and tolerance in the country.

After the crisis, in 2008, female employment registered a growth of less than 4,5% while for the young people the following figure shows a loss of more than 4,6%. Participation of the females to the labour market is high (more than 46% of the employed are female) but after the crisis, the young females have registered a strong stop loosing position in the gender equality distribution of job.
Another indicator of openness is the degree to which citizenship is granted. The following figure shows that in Austria there was a strong stop in the granting of citizenship in the period before the crisis (2003-2007). From 2008 to 2012 a fall of 32% is registered but in the last period it started to grow (from 50% in 2010 to 68% in 2012).

Crimes registered by the police show a fall from 104 to 96 from 2007 to 2012 and, in the last 3 years, an increase of 2.2%.

The following figures illustrate the situation of young people in Austria. Although the crisis has resulted in an increase in the risk of exclusion of young people from 16.6% in 2007 to 21% in 2012 (figure 29), as regards the school drop-out rate there has been a decrease from 10.7% in 2007 to 7.3% in 2012 (figure 30). In this respect, social inclusion policies seem to have been effective for the young.
To complete the picture, the table below shows 4 trust indicators, collected for the year 2006. The first indicator shows the importance of family solidarity: in Austria 91.7% of the population has a strong network of family relationships. The second indicator shows trust in other people and is measurable through participation in voluntary activities: there is a slight difference between adults and young people but it is possible to say that Austrian society trusts the others. The last trust indicator is the participation in activities of charitable organizations (6.6%).

Source: Eurostat

**Culture and Creativity**

To understand the resilience of the employment in a country, an economic analysis is necessary. The following figures show the trend in GDP in Austria, directly related with the CCIs. In the last 10 years GDP in the cultural and creative sector registered a rise of 30% with an average growth rate of 3% per year. Within the national trend, the contribution of culture and creativity is equivalent to approximately 1.3% of the total Gross Domestic Product.

After 2007 the indicator shows a growth of 0.8% in 2 years and then a stabilization between 1.4% and 1.37%.
The role of public policy in cultural and creative industries is always important and the following figures show the public engagement in the cultural sector: although the trend in public expenditure seems to grow in the past 10 years, the percentage of public expenditure on general expenditure remains at the same level and starts to slow down only after 2007. In Austria 3% of general public expenditure is dedicated to culture.

Demand and Supply of Culture and Creativity

Setting a framework for cultural supply and demand is necessary in order to understand the general environment in which cultural production happens.

Austria counts 9 UNESCO sites and 493 museums (5.2 museums per 100,000 inhabitants) while 39.2% of the population visits cultural sites (20.6% more than 4 times per year), 41.5% goes to the cinema (23.4% more than 4 times) and 54% of population attends the performing arts (36.6% more than 4 times per year).

Education

Another important aspect of the creative sector is education. The following figures show the trend for the tertiary students in general and in the creative sector.

While the number of students enrolled in tertiary schools is growing, the number of those enrolled in Journalism and Information has decreased by 4.5% in the last 3 years; and, in general, the number of students in culture-related studies is growing less than the general figures.

In 2012 students in Architecture were 38% more than those in 2008; students in the Humanities registered an increase of +14% and in in the Arts +16.1%.

As regards students in culture-related matters numbers grow until 2007 in respect to the total tertiary students’ population whereas in 2012 they are less than the 20% of the overall student population.

Employment and Young employment in CCIs

Data for the cultural and creative sector are available from 2008: the following figures show that employment in the sector is growing less than general employment in Austria.

The worst performance is registered for the young with a loss of 28% of employed from 2008 to 2013 while the total number of employees of the same age loses less than 4% in the same period.

The cultural and creative sector suffers also as regards adult employment: whereas general employment rose of 2%, the CCIs lost approximately 2% of jobs.

The trend is confirmed by Figure 38 which clearly shows that in 2008 the young employed in CCIs were more than 3% of the total employed whereas in 2013 they were less than 2.5% with the total employment in the sector stable in the same period.
The data collected for each sector of the CCIs, presented in the following figures makes it possible to argue that the trend in cultural and creative employment fluctuates. The worst performance is registered by the employed in “Libraries, archives and museums” (NACE 91) that lost, in the last year, 24% of the employed. This sector represents 12.2% of the total employed (2013) in CCIs and from 2008, after a first period of growth, it had a strong fall in 2013.

“Publishing activities” (NACE 58) lost 50% of employed in the first part of the period and after 2012 rose again to 88%, losing an overall 12% in the 6 years. Similar trends are registered by the employed in “Motion pictures” (NACE 59) and “Program and broadcasting” (NACE 60). The first, after a first period of crisis show a positive trend last year; the second stands at 81% in 2013, losing 19% of employed in 6 years.

The “Creative arts and entertainment sector” (NACE 90) is the one that registered a stable trend in the period and the most relevant percentage of employed.

The following figures focus on young employment. The only sector that seems to be resilient is the “Motion pictures, videos and television” (NACE 59) that represent 25.9% of the employed in culture, with a growth of 8% for the period. For the other sectors the worst performance is registered by “Programming and broadcasting” (NACE 60) that represent 5.6% of total cultural and creative employment. The young employed in “Publishing activities” (NACE 58) are 27% of the total employed in culture and registered a growing trend in the last year after a 5-year decrease period. The “Arts” sector (NACE 90 and 91)
which represents over 50% of the general youth employment in the creative sectors, registered a loss respectively of 60% and 53%.

**Figure 41. Trend in Employment in CCIs for sector of activity for young employed in Austria**

**Figure 42. Composition of employed in CCIs for young employed in Austria**

Source: Eurostat

**ICTs**

The Information and Communication Technology sector is described through the figures below. The first shows that mobile communication is the most dynamic sector with a strong registered growth rate in the last 10 years. Instead, every 26 of 100 inhabitants have a broadband subscription and about 40 have a fixed telephone line (from about 48 in 2003). The percentage of people that use the Internet registered a strong growth in the period reaching 80% of the population in 2013 from 42,7% in 2003.

**Figure 43. Fixed telephone, Mobile and broadband subscription per 100 inhabitants in Austria**

**Figure 44. Percentage of Individuals using the Internet in Austria**

Source: Eurostat

The following figures show employment trends in the ICT sectors. The only sector that faced the crisis positively is the one in “Computer programming” (NACE 62) that rose 40% in the last 6 years accounting for over 62% of the employed in the ICT sector (from 51,6% in 2008).

The other sectors suffered from the crisis and, in particular, “Information services and activities” (NACE 63) that represents 13,1% of the total employed in the sector and “Telecommunications” (NACE 62) that, after a first period of slight growth, in the last year has shown a slight decrease.
BELGIUM

Belgium is one of the founding Member States of the European Union (1952). It has a population of 11.1 million inhabitants. Young people are 1.3 million. In the last 10 years Belgium registered a 7.5% growth in population and a 7.2% growth in young population. The growing rate of students in tertiary education has made labour force of young people decrease in the last 5 years. Labour force has registered an increase of 3.5% percentage points from 2008 and of 11.6% from 2003.

Source: Eurostat

After a halt in 2008, GDP has started to grow again and has risen 10% in the last 5 years. The difference between the trend in GDP and the trend in GDP per capita shows a trend of concentration of resources. This trend is similar in many countries in Europe and elsewhere.

Belgium has also registered a strong increase of government expenditure: 20% in the last 5 years and over 40% in the 10 years (figure 50).
The figures below show the trends in employment and self-employment. General figures show a slight increase of employment and self-employment in the 10 years under review. In particular, the number of self-employed rose over 11% from 2008 and young self-employed over 30%. The labour market is becoming more flexible and self-employment is the result of this specific trend.

In general, after compulsory schooling young people in Belgium have either chosen to go on to tertiary education or to become self-employed.

**Social environment**

The situation of women shown in the figures below describes a dynamic trend. Generally the number of women employed has risen 17% in the last 10 years and represents 46% of the total employed.

The figures show that the trend is dynamic for young women who perform better than the rest.
As regards the granting of citizenship, in 2008 following a change in policy the number decreased and only last year it started to grow back to the level of 2008 (figure 55). In the same period, crimes registered by the police continued to grow and stopped only in 2012 (figure 56).

As regards young people at risk of exclusion, figure 57 shows that there is indeed an increase of the population in danger. As regards instead early school leavers figure 58 illustrates a trend by which this situation has become better in the last 3 years possibly due to the fact that young people have been pushed to continue their education.
European Expert Network on Culture (EENC)

Resilience of employment in the Culture and Creative Sectors (CCIs)

To complete the scenario the following table shows that 13% of the adult population practice active citizenship whereas less than 12% of the young do so and that the family networks are very strong.

Culture and Creativity

In the last 10 years GDP in the creative sector, as shown in the figure below, shows a very dynamic trend with an increase of 30%. In 2011, the contribution of CCIs to the Belgian GDP was approximately 1.8%.

Figure 59. Trend of GDP in CCIs in Belgium

Source: Eurostat

Figure 60. Contribution of CCIs to the GDP in Belgium

Source: Eurostat

As to the public sector, it has progressively decreased its commitment. While public expenditure in culture grew, the percentage of cultural expenditure in the general expenditure decreased very strongly from 2006 and was at 2.4% approximately in 2012.

Figure 62. Public cultural expenditure on total public expenditure in Belgium
Demand and Supply of Culture and Creativity
To contextualize the CCIs data, cultural heritage is one of the parameters to measure cultural supply. The table below shows that Belgium counts 11 UNESCO cultural sites and 162 museums (1,5 museums per 100,000 inhabitants).

<table>
<thead>
<tr>

<td>2004</td>
<td>162</td>
</tr>
</tbody>
</table>

Source: Eurostat, EGMUS

Participation in cultural activities is shown in the table below. 41,6% of Belgians visit cultural sites (16,1% more than 4 times); 47,4% go to the cinema (23% more than 4 times) and 44,6% attend live performances (16,9% more than 4 times). The table shows also the number of times that people repeat the experience of participating in cultural activities and 11% of the population is a strong consumer: 11% attend cinema; 6,9% performances and 6,8% visits cultural sites.

Education
As stated before, the number of students in tertiary education has grown strongly in the last 6 years but as regards education in culture related matters figures show an opposite trend.

Indeed, only for architectural studies figures show a more dynamic trend but, at the end of the period, they still show lower numbers than those for general tertiary studies.

Employment and Young employment
The following figures show the trend in employment of young people and adults in the CCIs as compared with total employment. The figures show that employment in the CCIs reacts better to the crisis than the general trend in Belgium. 3,7% of the young are employed in the CCIs and 1,5% of the total employed work in the CCIs.
Figure 65. Employment and young employment in Belgium (Total and in CCIs)

Figure 66. Composition of Employed in CCIs on total employed in Belgium

Source: Eurostat

Focusing on the CCIs, the only sector that registers a strong crisis is the “Publishing” sector (NACE 58) while all other sectors show a resilient trend especially for “Motion picture” (NACE 59): in 2013 they account for 17.3% of the total employed in the CCIs with a rise of +66% since 2008. In the last 6 years those employed in the “Creative arts and entertainment” sector (NACE 90) show a positive trend with a 14% increase, accounting for 31% of those employed in the CCIs.

The “Programming and broadcasting” sector (NACE 60) grew 29% in the past 6 years, albeit with a fluctuating trend and accounts for 13.1% of the total employed in the CCIs. As regards those employed in the “Libraries, archives and museums” sector (NACE 91), after a first period of increase, in the last year they have decreased bringing them to 19% of those employed in the CCIs.

Figure 67. Trend in Employment in CCIs for sector of activity in Belgium

Figure 68. Composition of employed in CCIs in Belgium

Source: Eurostat

As for the young employed the trend is different. The following figures show that the two sectors that are resilient are the “Programming and broadcasting” sector (NACE 60) and the “Creative arts and entertainment” sector (NACE 90). For the first, data available through Eurostat shows a brake in time series trend in the first sector Eurostat data have a break and is impossible to show the correct trend. Data in 2010 are consequently estimated. The two dynamic sectors prove that more than 50% of young professionals working in the creative economy have a positive and resilient trend.
European Expert Network on Culture (EENC)
Resilience of employment in the Culture and Creative Sectors (CCIs)

Figure 69. Trend in Employment in CCIs for sector of activity for young employed in Belgium*

![Graph showing trend in employment in CCIs for young employed in Belgium.](image)

Source: Eurostat
*(NACE 60 has a break in time series from 2010)

ICT

The ICT sector in Belgium is growing especially due to mobile telephones while the fixed line telephone presence is slowly going down. A strong increase is registered with the broadband and more than 80% of the population has access to the Internet.

Figure 71. Fixed telephone, Mobile and broadband subscription per 100 inhabitants in Belgium

![Graph showing fixed telephone, mobile, and broadband subscription per 100 inhabitants in Belgium.](image)

Source: Eurostat

Except for the “Telecommunications” sector (NACE 61) where in the last 5 years employment has decreased approximately 20%, the “Computer and programming” (NACE 62) and the “Information services” (NACE 63) sectors show a positive trend, more than the general trend in employment. The two sectors represent more than 73% of employment in the ICTs.

Figure 72. Percentage of Individuals using the Internet in Belgium

![Graph showing percentage of individuals using the Internet in Belgium.](image)
BULGARIA

Bulgaria has 7 million inhabitants of which approximately 10.8% are young people. The population, as shown in the figures below, has strongly diminished in the last 10 years especially as regards the young. Migration is one of the elements that explain this trend which is stronger for the young. As a result of this process, labour force is decreasing from 2008 due to the crisis and the trend in population.

The figures below show that in the last 10 years the GDP registered a strong growth, more than 7% per year in average (+70%). The general economy seems dynamic also because, as of 2009, the government stopped increasing public expenditure and only in 2013 general expenditure has been stronger than in 2009.

This trend has diminished the differences in income between the population. The gap between GDP and GDP per capita point out that the second indicator has increased more than the first.
Both the employed and self-employed are paying for the crisis. In fact, after 2008, the growing trend has strongly decreased especially for the young employed and self-employed: in 5 years, as the figures below show, the employment rate has gone down 5% (37.4% for young people).

Source: Eurostat

*break in time series from 2010

Social environment

The creative sector flourishes in countries where society is inclusive, tolerant and there is a high rate of use of technologies. One of the indicators of such inclusiveness is female participation in the labour market. The following figures show that women employed register a similar trend of that of general employment but the final result shows an overall better performance of women: indeed, they represent over 47% of the total employed but for the young women the figure is strongly worse.
Figure 81. Trend in Female employment in Bulgaria

Figure 82. Female participation to labour market in Bulgaria

Source: Eurostat

The following figures show the permeability of society and social disease. In the first figure a break in time series does not display a continuous trend but if data before and after 2008 is taken into consideration, the figure shows a growth in the acquisition of citizenship.

Trend in recorded crime shows a strong rise of crimes from 2008 to 2010 and an opposite trend from 2010. In many cases this cannot have the meaning of a decrease in crime but a rather in trust.

Figure 83. Acquisition of Citizenship in Bulgaria*

Figure 84. Trend in crimes recorded by the police in Bulgaria

Source: Eurostat
(*break in time series from 2008)

The general situation of young people is not a positive one. About half of the young population is at risk of poverty and since 2008 these numbers are increasing.

On the other hand the number of young people that drop out of school is going down.
In Bulgaria trust in family is lower than in other countries and, in general, the population does not seem to be very active. Only 3.2% of adults participate in voluntary activities and only 2.3% of young people. Only 1.2% of the population participates in the activities of charitable institutions. In general it is possible to say that many indicators show that there is a scarce trust between the population and in social life.

### Culture and Creativity

Before the crisis the trend in the creative sector was very strong registering a 64% growth rate. After 2008 GDP in this sector has fallen more than the general economy. In 2011 the CCIs contributed to 1.46% of GDP.

2008 represents a milestone also for public expenditure on culture. Bulgaria cut the expenditure in culture in 2009 but after, it started to fund culture again. In general, public expenditure is 4% of the total expenditure.
Demand and Supply of Culture and Creativity

The indicator of the supply of cultural goods shows that in Bulgaria there are 7 UNESCO cultural sites and 188 museums.

Table 10. Number of UNESCO cultural sites and museums in Bulgaria

Source: Eurostat, EGMUS

The participation in cultural life is not very high. Only 12.2% of the population visits cultural sites, 13.4% goes to the cinema and 15% attend the performing arts. In general, people that consume cultural goods are not frequent attendants.

Source: Eurostat

Education

Tertiary students in cultural related studies are about 12% of the overall student population. Among them the most important number is represented by students in the Humanities. Students in Architecture and the Arts provide for a more dynamic trend than the rest of the student population. A weak trend is registered by students in the Humanities, Journalism and Information.
Employment and Young employment

The following figures show employment in CCIs for adult and young people. Generally, those employed in the CCI’s show a resilient dynamic because the trend in general employment is lower than the one in CCIs. Of the total employed, those employed in the CCIs are 1.3% of young people and 7.4% of adults.

As shown in the figures below, data from Bulgaria are not complete. The most important sector are “Programming and broadcasting” (NACE 60) and “Creative Arts and entertainment” (NACE 90) that represent 54.8% of the total employed in the CCIs. Because of the lack of data for activities it is difficult to say if the creative employment is resilient or not.
In the same way, it is very difficult to find an answer to the question for young people. The following figures show the lack of data for the period under study.

**ICT**

Like in many other countries, the most dynamic sector is the one of mobile telephone communications with a growth rate, in the last 10 years, of over 80%. A slow increase is registered for broadband available for 20% of the population.

People with access to the Internet are 53%, considerably one of the lower in Europe.
The following figures show the trend in ICT employment. Also in this case, the lack of data is one of the reasons why it is difficult to give an answer to the question of resilience. A general trend for communication and computer programming is a slight indicator for a development of the sector and shows a better performance of the total employment.

**Figure 101. Trend in ICT Employment in Bulgaria**

**Figure 102. Composition of ICT Employment in Bulgaria**

Source: Eurostat

**CROATIA**

Croatia has a population of 4.2 Million and is a member of the European Union from 2013. The following figures show that whereas population has been quite stable in the last 10 years young population is decreasing and that, for this reason, labour force is diminishing.

**Figure 103. Trend in population in Croatia**

**Figure 104. Trend in labour force in Croatia**

Source: Eurostat

In the last 10 years Croatia registered a strong growth in GDP especially in the first part of the past decade (+30%). After 2008 GDP started a slight decline losing about 9% in the last 5 years. Especially from 2011 Croatia started to cut public budget with a 4% less in 2013 than in 2008.
Figure 105. Trend in GDP in Croatia

Figure 106. Trend in general government expenditure in Croatia

Source: Eurostat

The following figures show the trend of employment and self-employment in Croatia: the effect of the crisis is strong both for the employed and the self-employed. The employed have lost 15% in the last 5 years, while the young employed have lost 47%. The self-employed are 20% less than in 2008 and the decline has especially affected young people.

Social environment

The general environment for the development of creativity is described in the following figures. Women employed are facing the crisis in a better way than the general trend: 11.4% have lost their jobs against 42.5% of young women. Women are 46.5% of the total work force (40% are young).

Source: Eurostat
As described by the following figures, in Croatia the crime rate has registered a slight decrease in the past 5 years, and in the same period the granting of citizenship has strongly gone down. While the first indicator shows a good performance in social environment, the second shows a trend of closing towards strangers.

**Figure 111. Acquisition of Citizenship in Croatia**

**Figure 112. Trend in crimes recorded by the police in Croatia**

Source: Eurostat

In the last 3 years Croatia has a little more than 30% of young people at risk of poverty with, although, a high rate of young people included in the education system: the number of early school leavers has been only between 3.7 and 4.2% in the past 6 years.

**Figure 113. Young people at risk of poverty or exclusion in Croatia**

**Figure 114. Early leavers from education and training in Croatia**

Source: Eurostat

**Culture and Creativity**

Croatia has no data available to describe the creative sector. The only indicator available is the rate of public expenditure for culture on General public expenditure: 5.1% in 2012.

**Demand and Supply of Culture and Creativity**

While data on cultural participation are not available, Croatia has 6 UNESCO cultural sites and 221 museums (4.64 per 100,000 inhabitants).

**Table 12. Number of UNESCO cultural sites and museums in Croatia**

</tr>
</tbody>
</table>

Source: Eurostat, EGMUS
The lack of information about cultural behaviour makes it pretty difficult to understand the general environment and to have a range of indicators that can show the general trend as well the policies for culture and creativity.

**Education**

The trend for tertiary students in culture related fields is shown by the figures below. While for Journalism and Information there is a peak in 2006 that generates a strange graphic, generally students in arts and are growing faster than the general trends. The larger part of tertiary students in culture-related matters are in the Humanities (6.8%), while in 2012 students in Architecture account for 4.2%, in the Arts for 2.8% and in Journalism for 2.3%.

![Figure 115. Trend in tertiary students in Croatia](image)

Source: Eurostat

**Employment and Young employment**

The following figures show the trend in employment and young employment in the field of culture and creativity. Those employed in the culture-related sector are 7.1% of the total employed in 2013 but the general trend is negative. Indeed, while since 2008 general employment has lost 15%, performance in employment in the CCIs is worse with a loss of 33.6% in the same period. Slightly better is the performance in employment of young people, (1.5% of total employed) with a better performance than the one registered in the general labour market for the same age.

![Figure 117. Employment and young employment in Croatia (Total and in CCIs)](image)

Source: Eurostat

The following figures show the trend for the different activities: the lack of data in some of the CCIs is one of the reasons why it is difficult to argue whether the labour market in CCIs is resilient or not. Consequently, only general trends can be described and this not in depth.

![Figure 118. Composition of Employed in CCIs on total employed in Croatia](image)
The only sector that seems to be resilient is the one related to “Libraries, archives and museums” (NACE 91): typically state-driven this can be the explanation of the reason why it is resilient. For the “Arts” (NACE 90) the performance after the crisis is negative and the trend is worse than the general trend. The same trend is registered by the “Programming and Broadcasting” sector (NACE 60). The lack of information is due to the fact that they represent a very small portion indeed of the labour market.

The analysis of young employment in the CCI, per activity, is very difficult. For example in NACE 59 there are only 400 employed and, when numbers are so small, it is difficult to have statistics and in many cases it is not economical. The following figures show the trend and the composition of the labour market for young people in the CCI, although the significance of the data is very low.

**ICT**

Like in many other countries the most dynamic sector for the ICT is the mobile communications sector. In Croatia there is a stable trend in fixed telephone (40% of inhabitants have a fixed telephone) and a growth of broadband that reaches 20% in 2013. In the same period the percentage of people that uses the internet is 66,7%, less than the majority of European countries.
The trend in employment in ICT is shown in the following figures. The best performance is registered by the “Information services” (NACE 63) that registered a growth of over 300% as of 2008. A very good performance is registered in “Computer programming” (NACE 62) that registered a growth of 240% in the last 5 years. On the contrary, the “Telecommunication” sector lost 30% of employed. The composition of employment in the 3 sectors shows a strong change in the market. While “Telecommunication” went from 61.4% to 30% of the total employed in the ICTs, the “Computer programming” sector shows the opposite trend.

Source: Eurostat

**CYPRUS**

Cyprus is a small country with less than 1 million in population and is a member of the EU since 2004. As shown in the following figures, population has increased in the last 10 years with only young people decreasing in number, especially from 2011. Nevertheless, as of 2012 the trend is changing and this is even clearer when matched to the labour force.
The following figures show the effect of the crisis on GDP and public expenditure. After 2008 the trend starts to change and, in the last two years, it starts to decline. In a similar way, general government expenditure is changing trend after a 10 year-period of growth.

The effect of the crisis is shown by the loss of employment that, from 2011, has affected the country. Although general employment decreases by 4.5% from 2008, for young people the rate is much higher, with a 30% loss. Similarly, the number of self-employed follows a longer term trend of decline, especially for the young population.
Social environment

The following indicators try to describe the level of openness and tolerance. The first 2 figures show employment of women and their level of participation in the labour market.

After a period of increase, since 2011 women’s employment has decreased following the general trend albeit at a slower rate. This is also true for the young female population. While 47% of employed are women, the rate for young women is 52.2%.

Figure 133. Trend in Female employment in Cyprus

Figure 134. Female participation to labour market in Cyprus

Source: Eurostat

The trend of acquisition of citizenship in Cyprus is negative, like in many European countries and the crime indicator shows an increase in crimes from 2009 with an inversion of the trend only in the last year.

Figure 135. Acquisition of Citizenship in Cyprus

Figure 136. Trend in crimes recorded by the police in Cyprus

Source: Eurostat

The inclusion of young people in the education process is reaching a good level and the trend is positive but, after 2009, the number of your people at risk of poverty has increased.
The family trust indicator is very high in Cyprus and participation in voluntary activities is also strong, both for the adult and young population.

Table 13. Other trust indicators in Cyprus

<table>

</tbody>
</table>

Indeed, indicators show that there is a good level of trust amongst people in the country.

Culture and Creativity

Despite the general situation, the CCIs seem to have a vital trend: they register a faster growth than the general economy and do not seem to be afflicted by the crisis. In the last decade GDP has increased over 50% with a faster growth rate since 2009. The trend in the CCIs accounts for the general increase in the country’s GDP (1,59% in 2011).

Public administration has reduced its commitment to the cultural sector especially since 2011. Still, as shown by the composition of cultural expenditure on total expenditure this trend started already in 2008.
Demand and Supply of Culture and Creativity

As regards supply, there are not many indicators available: there are 3 UNESCO cultural sites. The following tables show that cultural consumption is indeed very low.

Table 14. Number of UNESCO cultural sites and museums in Cyprus

Source: Eurostat

Education

The general trend in tertiary education shows that the number of those who decide to study cultural-related matters is growing. The most important trend is registered by Architecture and construction: in this case the high growth rate is due to the low starting level. Students in the Humanities have grown in the last 5 years while students in the Arts follow the general trend and students in Information and Journalism are fewer than in 2003.
Employment and Young employment

The trend in employment in the CCIs is shown in the figures below. Although there is a negative trend for young people, general labour market employment in CCIs shows a better performance than the general trend.

The analysis of the CCIs per typology of activity shows that since there is a lack of data in 2 sectors ("Publishing activities" and "Libraries, archives and museums") only a partial dimension of the phenomenon is possible. Indeed, the only sector that shows a higher performance is the “Creative arts and entertainment” sector (NACE 90) while the “Programming and broadcasting” sector has decreased by 40% in the past 5 years.
The lack of data on the employment young people makes it impossible to provide any analysis as to it.

ICT

About every Cypriote owns a mobile telephone, making mobile telecommunication the most dynamic sector in the country. The trend for fixed telephones shows a slow decrease as in many other developed countries whereas the growth of broadband is similar to that of other European countries. The use of the Internet is lower than the European average, reaching 65% of the population.

Figure 149. Fixed telephone, Mobile and broadband subscription per 100 inhabitants in Cyprus

Figure 150. Percentage of Individuals using the Internet in Cyprus

Source: Eurostat

The lack of data for employment in the “Information services” (NACE 63) gives a partial view of the labour market in the ICT sector. In general terms, after a period of strong growth the “Computer programming” sector (NACE 62) is going back to the levels of 2008 while employment in “Telecommunication” (NACE 61) shows a slow decline although less than that shown by the general figures of the labour market.

Figure 151. Trend in ICT Employment in Cyprus

Figure 152. Composition of ICT Employment in Cyprus

Source: Eurostat
CZECH REPUBLIC

The Czech Republic has a population of 10.5 million and is a member of the European Union since 2004. In the last 10 years the population registered a moderate growth but the trend for young people is strongly negative. The following figures show that the same trend applies in the labour force.

**Figure 153. Trend in population in Czech Republic**

**Figure 154. Trend in labour force in Czech Republic**

Source: Eurostat

The following indicators show the GDP and public expenditure trend both before and after the 2007 crisis. After a period of constant growth, in 2008 GDP dropped and started to grow again but, since 2011, it has started to decrease and public policy expenditure has followed the same trend.

**Figure 155. Trend in GDP in Czech Republic**

**Figure 156. Trend in general government expenditure in Czech Republic**

Source: Eurostat

With a 20% loss as of 2008 the effect of the crisis is clear as regards young employment. Nevertheless, general employment is quite stable with a loss of 1.3% over a 5 year period. Self-employment registered a slight increase both for young and adults as of 2008 but the trend has changed as of last year.
Social environment

Women’s employment reacts better than the general trend and, like in many other countries, employment of young women has a worse outcome. The result is a strong gender imbalance between the young employed. As for adult employment, women account for 43.4%.

The following figures show the trend for 2 indicators that give an idea on social environment in the Czech Republic. Starting in 2004, policies for the granting of citizenship changed following the entry of the Czech Republic in the European Union and the numbers of those being granted Czech citizenship decreased dramatically. On the hand, the crime indicator has registered a decrease as of 2007.
One of the effects of the crisis on the young population has been the increase in the risk of poverty and exclusion which started to grow in 2009. Also, in the same period the number of early school leavers has grown as a result of generalised societal difficulties.

As shown in the following table, family trust is very high in the Czech Republic while general trust in society is very low. Only 4.5% of adults join voluntary activities (3.5% of the young population) and 3.3% declare to participate in activities in charitable organizations.

<table>

**Culture and Creativity**

The following figures show the contribution of CCIs to the general economy. Although the trend in GDP growth in CCIs is considerably high in the first part of the decade, as of 2008 it started to decline and, in the last year available (2012), a negative trend surfaced. Similarly, the contribution of CCIs to general growth has declined as of 2006 and has reached 1.45% in 2012.
However, public expenditure in culture has strongly increased in the last 3 years, with an increase of 80% between mid-2011 and mid-2012 (the most important increase is in the “Recreation, Culture and religion” sector). At the same time, public expenditure in culture rose to an 8% of public expenditure (from 5% in 2011).

**Figure 167. Trend in public expenditure in Culture in Czech Republic**

**Figure 168. Public cultural expenditure on total public expenditure in Czech Republic**

Source: Eurostat

**Demand and Supply of Culture and Creativity**

The Czech Republic has 12 UNESCO cultural sites and 486 museums (4,16 per 100,000 inhabitants). As regards supply, the Czech Republic has a considerable heritage offer.

**Table 17. Number of UNESCO cultural sites and museums in Czech Republic**

**Education**

The following figures show the trend in tertiary students. From 2008 the trend is similar for all the disciplines and only for journalism and information data shows a strong fluctuation during the past 10 years. Students in the Humanities are the most numerous (7,2%) whereas students in Architecture and construction account for 4,5% and those in the Arts for 2,1%. The total number of students in culture-related matters accounts for approximately 14% of the student population in tertiary education.
Employment and Young employment

In the Czech Republic employment in the CCIs accounts for 1.7% and for 5.5% of young people. The general trend shows that employment in the CCIs has a better performance especially among young people. In 2013 the number of the young employed in the CCIs inverted a trend that was slightly decreasing since 2010.

The following figures show the analysis by sector: 56% of employed in the CCIs are in the “Arts - Creative arts and entertainment” sector (NACE 90) and in the “Libraries, archives and museums” sector (NACE 91): these 2 sectors influence the general trend in employment in the CCIs.
As regards young people the composition of employment changes considerably from one year to the next the reason being the limited numbers of the young people employed in the CCIs.

**Figure 175. Trend in Employment in CCIs for sector of activity for young employed in Czech Republic**

Source: Eurostat

### ICT

In the Czech Republic the ICTs register the same general trend as in the rest of Europe. On the one hand, mobile subscriptions are increasing rapidly while, on the other, the number of fixed telephones is decreasing. Broadband penetration increases with a trend similar to that of other countries and the percentage of the population that uses the Internet is over 70%.

**Figure 177. Fixed telephone, Mobile and broadband subscription per 100 inhabitants in Czech Republic**

Source: Eurostat

The trend in employment in the ICT sector is more dynamic than the general trend, with the exception of the “Telecommunication” sector (NACE 61) which is facing a strong crisis and has, since 2011, lost over 28% of those employed. The “Computer programming” sector (NACE 62) accounts for 64,1% of the employed in the CCIs and has registered a 53% growth in the period analysed.

**Figure 178. Percentage of Individuals using the Internet in Czech Republic**

Source: Eurostat
DENMARK

Denmark has been member of the European Union since 1973. In 2013 it had population of over 5,6 million, of which 700.000 aged 15 to 24.

The following figures show the trend as regards both population and labour force: Denmark is one of the few countries in which the young population grows faster than the adult one; but, as regards labour force, it has started to decrease in 2008 with young labour force at a fluctuating trend.

As regards GDP growth it can be noted that, after a halt in 2008, it started to grow again in 2009 registering a 6% increase from 2008 to 2013. In the same period the total public expenditure registered a constant increase until 2012 when the trend was inverted.
After 2008 employment in Denmark started to decrease also as regards young people who, in the same period, lost about 10% of the employed. As regards self-employment, the trend is moderate but the situation of young employed is extremely changeable: on the one hand, the number of the young self-employed is low while, on the other, the young self-employed are more resilient to change in the labour market.

Social environment

In Denmark 47.5% of the employed are women and the number of young women employed exceeds that of adults. The trend in employment follows the general trend but the number of women employed decreases at a slower rhythm than the general trend.
The following indicators help understand social environment: the number of new citizens has highly decreased since 2004 whereas the crime rate increased until 2007 and then started a lower turn.

Source: Eurostat

Trust in general environment is confirmed by the following figures which show that, while the numbers of young people at risk of poverty are increasing, the number of early school leavers is strongly decreasing.

Source: Eurostat

In Denmark, the social structure relies strongly on family and trust: indeed, 97,1% of the Danes declare to be able to ask relatives or friends for help. Similarly, the active participation of the citizenship is very low and only 3% of adults declare to participate in voluntary activities (only 2,3% among young people) but 12,1% participate in activities by charitable organizations. The TABLE below shows that there is a different tradition or behaviour: participation in voluntary activities is very low if compared to other countries but participation in activities by charitable organizations is higher than the European average.

Source: Eurostat
Culture and Creativity
The creative sector contributes 1.83% to the total GDP in Denmark. However, the trend in the past 10 years has been negative and general contribution to GDP has strongly decreased since 2003 and, in absolute terms.

Figure 193. Trend of GDP in CCIs in Denmark
Figure 194. Contribution of CCIs to the GDP in Denmark

Source: Eurostat

The general trend is confirmed by the figures below: in the last years, public expenditure in culture has suffered strong cuts falling at 4.1% of the total expenditure in 2010, the worst situation in 10 years. The increase in trend that has followed is only a monetary illusion.

Figure 195. Trend in public expenditure in Culture in Denmark
Figure 196. Public cultural expenditure on total public expenditure in Denmark

Source: Eurostat

Demand and Supply of Culture and Creativity
As regards supply, Denmark has 3 UNESCO cultural sites and 281 museums: a considerably high number in relation to the overall population.

As regards demand, 54.3% of the population visits cultural sites; 59.3% goes to the cinema and 52.8% attends live performances thus demonstrating a strong attitude towards cultural participation. Over 22% of the population visits cultural sites more than 4 times a year; 24.7% goes to the cinema more than 4 times a year and 18.1% attends live performances more than 4 times a year.

Source: Eurostat

Education
The trend in tertiary education is shown in the figures below: the most important trend is the one registered in “Architecture and building” with 4.6% of the total number of students while the number, although small, of students in “Journalism and information” grows at a faster rate than the general trend (1.2% of total students). The number of students in the “Humanities” registers a negative trend going down from 16.5% to 9.2% and the number of students in the “Arts” registers a slight positive trend albeit lower than that of the total of students.

Employment and Young employment
The figures below show the trend of employment in Denmark in the CCIs compared to the general trend. Those employed in the CCIs are 2.5% (5% among young people) and, starting from 2008, the general trend has been negative. On the one hand, the negative trend of employment in the country has affected the CCIs whereas, on the other, the trend for CCIs in the last year has followed an inverse trend.
The following figure shows the trend for each NACE sector: the most dynamic sector is the “Motion picture and television” sector (NACE 59) which represents 11% of total employment in the CCIs; a good performance is registered by the “Libraries, archives and museums” sector (NACE 91) which represents 29.6% of the total employed in the CCIs. The “Creative art end entertainment” sector (NACE 90) account for 20.1% of the total employed in the CCIs and follows a trend similar to the general one while “Publishing” activities (NACE 58) have registered a negative trend, falling from 32.8% in 2008 to 24.5% in 2013.

Source: Eurostat

A similar trend appears as regard young people, except for seasonal phenomena (see figure below): the most resilient sectors seem to be the “Motion pictures” and “Libraries, archives and museums” with the last often connected with to the public sector.

Source: Eurostat

ICT

The analysis of the ICT sector in Denmark shows that the country is highly dynamic: on the one hand, mobile technologies are growing faster and, in parallel, fixed ones are decreasing faster than in other countries; on the other, broadband penetration is very high with over 40% of the population having access to it and over 90% of people use the Internet.
While the “Telecommunication” sector (NACE 61) has lost employees, going from 22.7% to 14% of the total employed in the ICT, a positive trend is registered by the other 2 sectors and, in particular, by the “Information services” sector (NACE 63) that represents a little portion of the total employed in the ICTs. As regards the “Computer programming” sector (NACE 62) it has shown a good performance and represents with over 80% of the total employed in the ICTs.

Estonia, one of the three small Baltic countries, has a population of 1.3 million inhabitants and is a member of the European Union since 2004.

In the last 10 years the total population and labour force has slightly decreased especially as regards young people.
In the past 10 years the country registered a positive trend in GDP and, consequently, also in public expenditure. The figures below show the effect of the crisis: as of 2007, and after two years of stall, GDP started to grow again with a rate similar to that of the pre-crisis years.

The situation as regards employment and self-employment demonstrates that although young people are particularly affected by the negative trend generated by the crisis the self-employed have reacted faster to the situation than the employed.
Social environment

Estonia shows a high “gender equality” profile: indeed, about 50% of those employed are women both among the adult and the young population. The trend as regards employment of women is quite similar to the general one.

Source: Eurostat

As in many other European countries, as of 2004 there has been a strong decrease in the granting of citizenship.

Also, as of 2007 the crime rate has strongly diminished, decreasing by 80% in 5 years.

Source: Eurostat

The number of young people at risk of poverty has increased in the last 5 years while, in the same period, the number of early school leavers has decreased.
Estonians have a good sense of citizenship and show a high degree of participation in voluntary activities (31.1% of the adults and 28.8% of the young).

In general terms, figures allow saying that there is a strong sense of community, typical in small regions, and also a very strong sense of family and social relations.

Culture and Creativity

In 2012 the contribution of Estonian CCIs to the country’s GDP was equivalent to 1.27% having decreased yearly from its 2008 peak of 1.8%.

The negative trend outlined above is confirmed by the figures below: public expenditure in culture registered a peak also in 2008 and has decreased since and as of 2005 the percentage of public expenditure dedicated to culture has also started a slow decline moving from 10% to 8%.
European Expert Network on Culture (EENC)  
Resilience of employment in the Culture and Creative Sectors (CCIs)

Figure 223. Trend in public expenditure in Culture in Estonia

Figure 224. Public cultural expenditure on total public expenditure in Estonia

Source: Eurostat

Demand and Supply of Culture and Creativity

In relation to its population, Estonia has a high number of museums (16.59 per 100,000 inhabitants). It also has 2 UNESCO cultural sites.

Cultural behaviour is very strongly connected to cultural consumption: 34.4% of the population declares visiting cultural sites (9.7% repeat the cultural experience more than 4 times per year); 29.5% goes to the cinema (11.6% are assiduous consumers) and 53.5% attend live performances (20.5% more than 4 times). Indeed, a high percentage repeats the cultural experience more than 4 times per year.

Education

In 2012 over 20% of tertiary students chose culture-related subjects for which there seems to be a growing interest if compared to other areas of study: 7.1% of students chose the “Humanities”, 5.7% the “Arts” and 5.5% “Architecture and building” while 1.7% chose “Journalism and Information”. This particular sector showed a strong increase in 2007 and has been excluded from the chart illustrating the general trend.
Employment and Young employment

Employment in the cultural and creative sector shows a resilient trend after the crisis. From 2007 onwards and, especially for young people, there has been a strong increase of employment in this field which went from an initial 1.2% within general employment to 5.8% in 2013. Indeed, during the period analysed employment in culture registered a better performance than general employment.

When assessing the situation per sector, and as shown by the chart that follows, information for the “Programming ad broadcasting” (NACE 60) and “Motion pictures” (NACE 58) sectors has been collected only as of 2012 and thus does not allow for any consideration being made as regards these specific sectorial trends.

As for the other sectors “Libraries, archives and museums” (NACE 91) show a positive trend, probably due to the high number of museums in the country, and the “Creative Arts” (NACE 90) also show a good performance in the past 5 years. On the contrary, there is a negative trend for the “Publishing activities” (NACE 58) that registered a fall of over 40%, from the initial 25.8% of total employment in CCIs to the current 20.3%.
The “Creative Arts and entertainment” sector (NACE 90) registers the most dynamic trend among young people as does the “Libraries archives and museums” sector (NACE 91) while a negative trend appears for the “Publishing activities” sector (NACE 58).

ICT
Today, 20% of Estonians use the Internet and, in 10 years, the digital divide has mostly disappeared. The trend in mobile subscriptions is very strong and, although it registered a stop the crisis, it started to grow again in 2010. Broadband has reached 26% of the population and 33% of inhabitants have fixed telephone lines.
In Estonia the ICT has a strong performance: the growth rate of "Computer programming" (NACE 62) and "Telecommunication" (NACE 61) is over 40% for the first and 20% for the second whereas nothing can be said about the "Information services" (NACE 63) due to the lack of data.

Source: Eurostat

**FINLAND**

Finland has been member of the European Union since 1995 and has a population of 5.3 million.

The demographic trend showed in the following charts shows that the young population grows at a slower rate than the general population. On the other hand, in the last 10 years labour force in Finland has been stable.

**Figure 237. Trend in population in Finland**

**Figure 238. Trend in labour force in Finland**

Source: Eurostat

As regards GDP the chart shows that the crisis had a negative effect in 2009 but that, afterwards, GDP started to grow again as early as in 2010. In the same period the Finnish economy was supported by public expenditure: this registered a constant increase during the same period.
The crisis generated a loss of employment while self-employment partially bypassed the employed situation. A similar trend is registered among the young population.

**Social environment**

As observed in other countries, women show a higher degree of resilience in employment: whereas general employment in Finland decreased by 5.3%, women lost 4.7%. The presence of women in the labour market is very high, on average a little under 49% and among the young it reached a peak 53% in 2013.

Source: Eurostat
The Finnish society seems to have a good indicator of tolerance towards new citizens, and the crime rate has been stable throughout the last 5 years.

![Figure 245. Acquisition of Citizenship in Finland](image1.png)

![Figure 246. Trend in crimes recorded by the police in Finland](image2.png)

Source: Eurostat

As regards indicators of poverty risk for the young and social inclusion in the last 2 or 3 years there have been encouraging results.

![Figure 247. Young people at risk of poverty or exclusion in Finland](image3.png)

![Figure 248. Early leavers from education and training in Finland](image4.png)

Source: Eurostat

Trust and family networks are highly valued by Finnish society.

Source: Eurostat

Generally, Finland has developed a good environment for creativity.

**Culture and Creativity**

The following charts show the trend in CCIs GDP and their contribution to the total GDP: in Finland the CCIs have contributed to economic recovery more than in other countries. In 2012 the total contribution of CCIs GDP to the economy was 1.8%, confirming the slight negative trend initiated in 2009.
Cultural expenditure is stable in the country; in terms of trend, it is actually growing more than the GDP but in terms of percentage it is stable fluctuating from 3,2% to 3,3% of the general public expenditure.

Demand and Supply of Culture and Creativity
The cultural behaviour of the Finnish is described by the following data. As regards supply, the indicators show that Finland has 6 UNESCO cultural sites and 325 museums (5,34 per inhabitants).

Table 26. Number of UNESCO cultural sites in Finland

Source: Eurostat

Education

Less than 20% of students decide to study cultural-related subjects: 8.3% of them study Humanities, 5.5% Arts, 4.6% Architecture and buildings, 0.9% Journalism and information. While for students in Arts the trend is similar to the average, Architects register a strong growth in the last 10 years.

Employment and Young employment

The following chart shows that jobs in the CCIs are resilient both for adults and young people. Employment in the creative economy has grown faster than the general economy: in 2013 it represented 4.1% of the total young people employed and 2.4% of the total employed.

The only exception is represented by the “Motion pictures” sector (NACE 59) that registered a negative trend in the last 4 years. For the other sectors growth rates and dynamics are indeed stronger than the average.
The sectors that are the most representative are the “Creative arts and entertainment” sector (NACE 90) which accounts for 36% of those employed in culture and the “Publishing activities” sector (NACE 58) which accounts for 29% of the total employed in the CCIs.

**Figure 257. Trend in Employment in CCIs for sector of activity in Finland**

**Figure 258. Composition of employed in CCIs in Finland**

Source: Eurostat

Similar considerations can be done as regards the young employed in the CCIs although for those employed in the “Motion pictures” (NACE 59) sector there has been a negative trend, albeit with a good number of members.

**Figure 259. Trend in Employment in CCIs for sector of activity for young employed in Finland**

**Figure 260. Composition of employed in CCIs for young employed in Finland**

Source: Eurostat

**ICT**

ICTs are very developed in Finland: 90% of the population uses the Internet and 35% has access to broadband; as regards mobile subscriptions, the trend in the last 10 years has been of a very high growth rate.

The negative trend for fixed telephone subscriptions confirms the general trend for the ICTs.
The charts below show that the only sector that suffers from the crisis is the “Telecommunication” sector (NACE 61) while “Computer programming” (NACE 62) is the most important sector both numerically and as regards the general trend.

Source: Eurostat

FRANCE

France was one of the founding members of the European Union in 1952. In 2013 it had a population of 64.3 million.

The population growth rate and the trend in labour force are displayed in the charts below: in the last 10 years the population has increased a 5.3% and a similar trend is registered for labour force. As regards the young population the trend is the one common for this type of “mature” country in which the birth rate is very low.
After 2007 the financial crisis had a two-year depression effect and, only in 2009, GDP started again to grow. The general government expenditure in the period shows a constant growth.

### Social environment

The women employed have had a better reaction to the crisis and the result has been a trend with a balancing effect as regards gender representation in the labour market. In 2013,
about 48% of the employed were women, growing from 46% in 2003. A similar trend is registered also as regards the young population in the labour force.

Source: Eurostat

In the last 10 years there have been profound changes as regards social cohesion and general trust: on the one hand the trend in the acquisition of new citizenship has decreased decreasing (Figure 273), the young population at risk of poverty has increased (Figure 275).

Source: Eurostat

Otherwise, a positive trend appears in the crime rate but also as regards early school leavers: both rates have decreased in the last 5 years.

Source: Eurostat
The degree of participation in social life is shown in the table below: both adult and young citizens are active but only 1.5% participate in charitable activities.

Culture and Creativity

As regards culture and creativity the trend in France is not a positive one: on the one hand the trend of GDP in CCI is has registered a slow growth in the last 10 years; on the other, the contribution of CCI to GDP has fallen from 1.87% to 1.73%.

Figure 277. Trend of GDP in CCI in France

![Trend of GDP in CCI in France](image)

Source: Eurostat

Public government expenditure in culture has stalled since 2008, representing 4.1% of general expenditure.

Figure 279. Trend in public expenditure in Culture in France

Source: Eurostat

Demand and Supply of Culture and Creativity

The two indicators for cultural supply show that in France there are 36 UNESCO cultural sites and 1.173 museums (1.6 per 100,000 inhabitants).

Table 29. Number of UNESCO cultural sites and museums in France

Education

The portion of students that attend tertiary education in culture-related subjects has diminished in the past 6 years. The negative trend is driven by the fall of students in the Humanities that go from an initial 12.1% in 2006 to a final 9.1% in 2013.

A different trend is visible for students in Architecture (2.4% of the total student population in 2013) and in Journalism (1.6% in 2013). A trend in line with the national trend is registered by students in the Arts who represent 4.2% of the total student population.

Employment and Young employment

The following chart shows that in France the employed in the CCIs are 1.8% of the total employed (2.9% of young people) and that the general trend of employment in the CCIs is positive. Indeed, those employed in the CCIs have a better performance both for adults and young.
The following figures show that, in the last 6 years, only the “Publishing activities” sector (NACE 58) has lost employment while all the other sectors show better performances as related to the general trend. Particularly significant is the growth rate in “Libraries, archives and museums” sector (NACE 91) while among the other sectors the trend shows a moderate growth. In 2013 the majority of the employed in the CCIs works in the “Creative arts and entertainment” sector (NACE 90) and in the “Publishing activities” (NACE 58) with 37.3% and 26% respectively.

Data for young people does not have the same reliability; however, the following charts show that the trend in the CCIs is, in many cases, better than the general trend.

ICT

Over 80% of the French population uses the Internet and almost every person owns a mobile device; 60% of the French have a fixed telephone line and the broadband reaches about 40% of the population.
Like in many other countries the "Telecommunication" (NACE 61) sector is losing jobs while in other ICT sectors the trend is otherwise positive: indeed, the “Computer programming” sector (NACE 62) accounts for 65.3% of the total employed in the ICTs and the “Information services” sector (NACE 63), after a period of growth from 2009 to 2012, has a trend in line with the general economy.

Germany France was one of the founding members of the European Union. In 2013 it had a population of 82 million.

The demographic trend shown in the following charts indicates that there is a progressive ageing of population. Labour force shows a slight decreasing trend and, among the young population, it is clearly falling at a higher rate.
Despite to the crisis, Germany’s trend as regards its GDP is strongly increasing and general expenditure has registered a stable growth rate, albeit with a pause between 2010 and 2013.

In the last years Germans have registered a positive trend as regards both employment and self-employment; the trend in young employment can be explained by the corresponding decrease of the young labour force.

**Social environment**

Like in many other European countries, the employment trend as regards women has proven more resilient: in Germany, employment rate for women has risen by 7% since 2008.
and the composition of the work force has changed favouring women’s participation who, in 2013, accounted for 46,3% of the total employed from an initial 45% in 2003.

Figure 299. Trend in Female employment in Germany

Figure 300. Female participation to labour market in Germany

Source: Eurostat

To measure trust in German society the following data shows that German citizenship policy is indeed quite open: in 2012 it was at the same level as in 2007. As regards the crime rate it has decreased from 2007 to 7,3 crimes every 100 inhabitants in 2013.

Figure 301. Acquisition of Citizenship in Germany

Figure 302. Trend in crimes recorded by the police in Germany

Source: Eurostat

The risk of exclusion of young people has considerably diminished except for the last two years and is currently at 25,4%. Since 2007 the number of early school leavers has decreased going from 12% to 10%.

Figure 303. Young people at risk of poverty or exclusion in Germany

Figure 304. Early leavers from education and training in Germany

Source: Eurostat
94.7% of Germans have strong family ties and the table below shows that both adults and young people are not only active in voluntary activities but also participate in charitable organizations.

Table 3. Other trust indicators in Germany

Source: Eurostat

Indeed, the data shows that there is a good level of trust between people and this because of the strong family ties and also the high level of participation in social activities.

Culture and Creativity

The CCIs in Germany have grown less than the general economy and, especially from 2009, have registered a halt as regards their contribution to the general economy. In 2013 the CCIs contributed 1.92% to national GDP from an initial 2.09% in 2009 but, in any case, the figure for 2013 is indeed higher than the one registered for 2003.

Public expenditure in culture has followed a fluctuating trend reaching a positive peak in 2007 (2.85% of public expenditure) and a negative peak in 2010 (2.63%). In 2013 it reached the same levels of 2007 meaning that, in general it has been stable throughout this period: peaks have probably been the results of specific events.
Demand and Supply of Culture and Creativity

Germany has 36 UNESCO cultural sites and 6,355 museums (7.5 museums every 1,000 inhabitants).

Table 32. Number of UNESCO cultural sites and museums in Germany

Education

In the last 10 years the number of students enrolled in culture-related studies has decreased. In the last years only the students in Architecture and buildings have, after a period of decrease, registered a new growth: they now represent 3.7% of the student population in tertiary education. The general trend in CCIs subjects is positive but still inferior to the total trend. Students in the Humanities account for 9.9% of the total student population, those in the Arts for 3% and those in Journalism and Information only for 1%.

![Figure 309. Trend in tertiary students in Germany](image)

![Figure 310. Tertiary students in Germany](image)

Source: Eurostat

Employment and Young employment

The employment situation in the CCIs follows a negative trend: from an initial 2.2% of total employment in 2008 figures have gone down to a registered 2% in 2013. This is particularly true for young people who have gone from an initial 4% to 2.9%. Employment in the CCIs has increased a slower rate than the general trend and, in the last years, it has decreased significantly.
The analysis of sectorial data shows that the driving sectors are the “Creative arts and entertainment” (NACE 90) and the “Motion pictures” (NACE 59) sectors while the negative general trend is driven by the downslide in the “Publishing activities” sector (NACE 58) which, although it represent 49.3% of general employment in the CCIs, has nevertheless registered a fall of 29% in the last 6 years. The “Creative arts and entertainment” sector (NACE 90) accounts for 27.3% of the total employed in the CCIs and is the driving sector of the CCIs in Germany: in fact, only this sector has proven resilience during the crisis and this thanks to the number of those that are employed and the general positive trend.

However, as regards employment the young fare worse than adults. Except for those employed in the “Libraries, archives and museums” sector (NACE 91) who registered a positive trend, those employed in other sectors have registered a negative performance. Among the young the most important sector is represented by the “Publishing activities” sector (NACE 58) that accounts for 63% of the total young employed in the CCIs; another 15.4% are employed “Creative arts and entertainment” sector (NACE 90) and 11.8% are those employed in “Motion picture” sector (NACE 59).
European Expert Network on Culture (EENC)
Resilience of employment in the Culture and Creative Sectors (CCIs)

Figure 315. Trend in Employment in CCIs for sector of activity for young employed in Belgium

Source: Eurostat

ICT

A very high rate of Germans (84%) use the Internet, while mobile subscriptions reach 120% of the inhabitants. 60% have a fixed telephone line and 34.6% have access to broadband.

Source: Eurostat

The general trend in employment in ICT is negative. Particularly negative is the performance of the “Computer programming” sector (NACE 63) where the employment rate has fallen approximately 50% in the last year (29.3% from 2008). A negative performance is also registered by the “Telecommunications” sector (NACE 61) that registered a decrease of 46.5% from 2008. The only ICT sector that registers a positive trend is the “Information services” sector (NACE 62) that, in 2013, represented 8.8% of total employment in the ICTs.
Greece has been a Member State of the European Union since 1971. In 2013 it had a population of 11.2 million. The trend in population and labour force has been stable for the past 10 years while, in the same period, the young population has decreased and the young labour force has followed the same trend.

The crisis had a strong effect on Greece: GDP has fallen by 20% in the last 5 years and, since 2009, Greece has cut very seriously its public budget.
The most relevant effect of the crisis is to be seen in employment: in 5 years Greece lost 20% of its jobs most of them among the young population. Indeed, the crisis is responsible for an overall strong negative trend as regards both employment and self-employment as shown by the charts below although the crisis has had less severe consequences for the self-employed.

![Figure 325. Trend in employment in Greece](image1)

![Figure 326. Trend in self-employment in Greece](image2)

**Source:** Eurostat

**Social environment**

Although the crisis has had consequences also as regards the women employed, still the trend is less severe than the general trend. In fact women’s participation in the labour market was higher in 2013 than it was 2003 and reached 40,3% at the end of the period under analysis.

![Figure 327. Trend in Female employment in Greece](image3)

![Figure 328. Female participation to labour market in Greece](image4)

**Source:** Eurostat

Despite the crisis, the crime rate has decreased since 2007 and, as regards the granting of citizenship, there has been an increase which attests that Greece is not facing this period by closing up the options and applying a rigid policy on this issue.
The rate of the young population at risk of poverty and exclusion is worrying since it has peaked at 45%; however, there are less young people that leave education before having completed their compulsory education period.

Family ties and networks are very strong in Greece: 96,5% of the population declare they trust their closer relatives and friends and social trust is considerably high among both adults and young people; 18,9% of adults declare participating in voluntary activities as do 15,7% of the young. Only 3,3% of the population declares participating in charitable activities.

**Culture and Creativity**

The CCIs in Greece are very performing. Despite the crisis the GDP related to CCIs has grown and, in 2011, it accounted for a 9,4% more than in 2008 and for a 54,3% more than in 2003. Over the same period, the contribution of the CCIs to the general economy has grown reaching 2,73% of the total GDP.
Since 2009 public expenditure in culture has not grown but, indeed, the budget cuts have not affected culture more than they have affected other sectors. The rate of cultural expenditure on total expenditure was 1,93% in 2013 (1,13% in 2003).

Cultural participation is not very high: 14,8% of the population declares visiting cultural sites during the year and only 2,4% more than 4 times per year; 38,4% goes to the cinema but only 16,5% more than 4 times per year; 31,3% attend live performances but only 7% more than 4 times per year.

Education

Data for tertiary students are not complete and it is therefore difficult to identify a general trend. Still, the following chart shows that students in the Humanities are the majority accounting for 12% of the total student population and those in Architecture and building account for 4.7%. Other sectors, such as the Arts and Journalism and information account for a very reduced percentage: 2.2% and 0.7% respectively.

Figure 337. Tertiary students in Greece

Source: Eurostat

Employment and Young employment

Those employed in the CCIs represent 1.2% of the total employed. The following charts show that those employed in the CCIs have, indeed, a good degree of resilience since they perform better than colleagues that work in other sectors. The trend is evident for the young employed (8.2% of the young employed) although it is a little less evident for adults.

Figure 338. Employment and young employment in Greece (Total and in CCIs)

Figure 339. Composition of Employed in CCIs on total employed in Greece

Source: Eurostat

The analysis of the data available clearly shows that, for the CCIs, the most relevant sector is the “Creative arts and entertainment” sector (NACE 90) which accounts for 30.1% of the total employed in the CCIs followed by the “Publishing activities” sector (NACE 58) which accounts for 27.3%. These 2 sectors seem to be the most dynamic and register a higher performance than the general trend, driving the overall positive trend visible for the CCIs.
Data concerning the young employed are less constant given the fairly limited number of the employed. In any case, the general trend is confirmed and the performance of the employed in the “Creative arts and entertainment” sector (NACE 90) and the “Publishing activities” sector (NACE 58) is not only better than the general trend but also drives the overall positive trend in the CCI.

ICT

The ICT sector in Greece has developed over the last years: 60% of the population uses the Internet and broadband reaches 26% of the population. Mobile subscriptions registered a stop in 2007 and have been stable over the last 2 years. Fixed telephone line subscriptions have decreased in the last 10 years but at a lower rate than in other sectors.
Trends for employment in the ICTs, shown in the following charts, indicate that the “Information services” (NACE 63) and the “Computer programming” (NACE 62) sectors are the 2 driving sectors while the “Telecommunication” sector (NACE 6) follows the general trend.

HUNGARY

Hungary has been a Member State of the European Union since 2004. In 2013 it has a population of 10 million inhabitants: the demographic trend in the country is slightly decreasing while the labour force has, in the last two years, increased thanks to new young labour force available.
After the crisis, the country faced a strong stop in its economic growth: GDP fell by over 10% between 2008 and 2009 and, in the following years, the country has not been able to reach the level of GDP it had before the crisis. Indeed, the crisis also affected the general expenditure which fell by 10% during the same years and which has, since, remained stable.

The crisis affected young people more than it did adults: whereas the general employment rate in 2013 was quite the same as in 2008, the trend for young people represents an 8.5% less than in 2008. A different situation appears for self-employment where the trend for both adult and young workers is negative.
Social environment
The number of women employed after the crisis registered a slight increase and the young women employed seem to be less affected by the crisis than the rest. The effect is an overall higher participation of women in the labour market which has reached 46% in 2013.

Source: Eurostat

The granting of citizenship reached its peak in 2010 and, from 2011, has been stable. Between 2007 and 2012 the number of crimes recorded rose by 15%.

Source: Eurostat

In the last 6 years the number of young people at risk of poverty has increased between 2007 and 2012 and is now at a worrying level of 37.8%. Over the same period the number of early school leavers initially decreased but has again increased in the last 3 years, reaching the same level as in 2007.
92% of Hungarians have trust in family and friendship and this is a good indicator of a healthy social and personal condition. Still general trust, measured by participation in voluntary activities and charitable organizations, is lower than in other European countries.

Overall, Hungary seems a relatively open country with the basic conditions for the development of the cultural and creative economy.

**Culture and Creativity**

The trend in GDP for the CCIs is generally better than the general trend: following an increase to 2% of the total GDP in 2007 there has been, since 2010, a slight decrease to 1,87%
Demand and Supply of Culture and Creativity

In Hungary there are 7 UNESCO cultural sites and 734 museums (6.6 per 100,000 people).

Education

The general trend for tertiary students in culture-related subjects has risen from 2003 to 2009 and then has decreased again, since 2012. The highest number of students are enrolled in the Humanities (6.6%) although the number has decreased since 2008; students in Architecture and buildings and in the Arts are growing but they were, respectively, at 3.2% and 2.5% in 2013. Journalism ad information accounts for 2.7% of the total student population and has decreased since 2008.
European Expert Network on Culture (EENC)

Resilience of employment in the Culture and Creative Sectors (CCIs)

Source: Eurostat

Employment and Young employment

The following charts show the trend and the composition of employment in the CCIs. In general terms, the employed in CCIs represent 1,7% of the total employed but are decreasing while young people represent 4,7% of the young employed and are increasing, albeit a lack of data in 2011 that make the trend discontinuous.

Figure 366. Employment and young employment in Hungary (Total and in CCIs)

Figure 367. Composition of Employed in CCIs on total employed in Hungary

Source: Eurostat

The trends in employment in the CCIs are shown in the charts below. The employed in the “Publishing activities” sector (NACE 58) are the most dynamic: they account for 0,52% of general employment and for the most important part of those employed in the CCIs. Still, as in many other countries, this sector is the one that is losing the higher number of jobs and where the crisis is stronger. The other sectors have a trend similar to the trend for the general employment: the “Programming and broadcasting” sector (NACE 60) rose by about 5% in the last 6 years reaching 0,21% of the total employed; the “Creative Arts and entertainment” sector (NACE 90) has been stable throughout the same period and the “Libraries, archives and museums” sector (NACE 91) has registered a negative trend and represent less than 0.01% of the total employed.

Figure 368. Trend in Employment in CCIs for sector of activity in Hungary

Figure 369. Composition of employed in CCIs in Hungary

Source: Eurostat

The trend for young people is scarcely significant due to the limited data available but a general trend can be nevertheless appreciated through the charts below.
The “Libraries, archives and museums” sector (NACE 91) in 2013 represent 0.6% of total employment and from an initial 0.1% have an increase rate of 600%, while the other trends are similar to the general trend.

**Figure 370. Trend in Employment in CCIs for sector of activity for young employed in Hungary**

**Figure 371. Composition of employed in CCIs for young employed in Hungary**

Source: Eurostat

**ICT**

In Hungary over 70% of people use the Internet and there are 120 subscriptions to mobile phones per 100 inhabitants. The fixed telephone lines subscriptions are less than 30% and the broadband reaches 24.1 inhabitants every 100.

**Figure 372. Fixed telephone, Mobile and broadband subscription per 100 inhabitants in Hungary**

**Figure 373. Percentage of Individuals using the Internet in Hungary**

Source: Eurostat

The employment in the sector is driven by the “Computer programming” sector (NACE 62) which represents 1.2% of total employment which has increased more than the general trend. In 2012 the “Telecommunications” sector (NACE 61) started to decline but the general trend registered is better than the European trend with 0.6% of total employment. The most dynamic sector is the “Information services” sector (NACE 63) which grows faster than the others but represents 0.3% of total employment. Overall, in 2013 employment in the ICTs accounted for 2% of total employment.
IRELAND

Ireland has been a Member State of the European Union since 1973. It has 4.6 million inhabitants of which 500,000 are young; its population has decreased notably in the last 10 years with a loss of 100,000 units. Consequently, the labour force is decreasing both for adults and young people.

The economic crisis affected Ireland more than other countries. The charts below show the trend in GDP and in government expenditure in the last 10 years: in 2013 GDP decreased by 9% and the general public expenditure followed a similar trend, with a peak in 2010.
Over the same period, 10.5% of jobs were lost. This trend hit the young generations especially hard with a loss of jobs equivalent to 45.3%. An even harder stronger effect of the crisis has been registered among the self-employed where there has been a decrease of 11.5% for adults and of 37.4% for the young.

Inclusion of women in the Irish labour market is very high: over 50% of the young employed are women and among adults they are 46%. The trend in female employment confirms the European trend and women have shown a higher resilience in employment than men: women employed lost 6% over the total and young women 44.3%.
In the last years citizenship acquisition in Ireland registered a strong increase. This indicator reflects a good permeability of the Irish society over the last years.

After the crisis, the situation of young people has worsened but public policies fostering inclusion seem to be effective. While the trend of the risk of young exclusion has increased, reaching 37.8%, the early school leavers have decreased to 8% from an initial 12% in 2007.

The social situation is represented in the table below: the value of family and closer relations is very strong. 96.6% of the population declare to be able to ask for help within their closer circle of relationships. The percentage of individuals that actively participate in social life is 25.6% for adults and 17.2% for the young. A strong participation in the activities of charitable organizations is another indicator that shows the level of trust in society. For reasons relating to tradition this indicator is higher in northern European countries.

**Culture and Creativity**

The following figures show the economic trend in CCIs. On the one hand, GDP in CCIs has increased in the last 4 years faster than in the general economy. In total, the GDP in the
sector loses a 7.8%, less than the general trend. The figures show that the contribution of CCIs to GDP is increasing reaching 0.94% of the total GDP.

**Figure 387. Trend of GDP in CCIs in Ireland**

**Figure 388. Contribution of CCIs to the GDP in Ireland**

Source: Eurostat

Public expenditure in culture registered a stop in 2009 and then started to grow again. In 2013 cultural expenditure represented 3.3% of the total public expenditure.

As regards demand, strong participation in cultural life is registered by people that attend live performances (46.5%) and go to the cinema (46%) while a lower rate is registered by people that claim they visit cultural sites (35.5%). The stronger cultural consumers, those who attend cultural activities more than 4 times a year, are divided as follows: 14.6% attend live performances, 23.1% go to the cinema and 14.1% visit cultural sites.
Table 42. Cultural behaviours in Ireland

Education

The following charts show the trend and the composition of tertiary students in Ireland. The most important number of students are registered in the Arts (6,4% of total tertiary students) and the Humanities (6,3% of total tertiary students). The students in Architecture and building are 3,7% of the total students population while 1,1% are students in Journalism and information.

In general, the trend for studies in culture-related subjects is worse than for the rest.

Employment and Young employment

In 2013 1,5% of the employed were employed in the CCIs; 1,6% of the young employed. The trend shown in the charts below illustrates that the employed in the CCIs registered a better performance than the general labour market. The trend is confirmed for both adults and the young employed.

The following charts show the trend and the composition of employment in the CCIs. The sectors that register a negative performance are the “Publishing activities” (NACE 58),
“Creative arts and entertainment” (NACE 90) and “Libraries, archives and museums” (NACE 91) sectors. Still, the latter registers a better performance than the general labour market. The employed in the “Motion picture, video and television program production, sound recording and music publishing activities” sector (NACE 59) and in the “Programming and broadcasting activities” sector (NACE 60) register a better performance than the general labour market. The largest number of those employed works in the “Creative arts and entertainment” sector (NACE 90) - 0.68% of the employed – while other sectors account for less than 0.26% of the total employed.

The employment trend for the young is different than for the adults. A better performance is registered for the “Creative arts and entertainment” sector (NACE 91) and for the “Publishing activities” (NACE 58). But, as it is possible to see from the charts below, the lack of data does not allow for a good level of reliability. 50% of the young employed in the CCIs works in the “Creative arts and entertainment” (NACE 90) and, for the past 10 years, their number has been stable.

In the ICT sector the market trend shows that both the mobile phone market and fixed phone market have decreased since 2008. The broadband penetration rate is rising constantly and 78.2% of the population uses the Internet.
In Ireland the labour market in the ICT has a similar trend as in the rest of Europe: while jobs in the “Telecommunications” sector (NACE 61) are decreasing, those in the “Computer programming” (NACE 62) and “Information services” (NACE 63) sectors are increasing. The total number of those employed in the ICT is equal to 3,5% of the total employed with the most important figure in the “Computer programming” (NACE 62) sector (2,4% of the total).

Source: Eurostat

ITALY

Italy was one of the founding members of the European Union in 1952. In 2013 the country had a population of over 60 million inhabitants.

While the overall population has slightly increased in the last 10 years, the young population is stable. The labour force, in the same period, rose by 1,7% while the young labour force registered a decrease of 12,6%. 
Although in 2008 the GDP stopped growing, after 2009 it has started to grow again, albeit a lower rate. The general government expenditure registered a growth until 2008 and, since 2009, it has stopped.

The following charts show that employment for adults has slightly decreased in the last 6 years; the same trend is apparent for the self-employed and for the young population the performance is even worse.

**Social environment**

The employment of women registers a different trend: whereas general employment has decreased over the last years, the number of women employed has increased reaching
41.6% of the total employed. A similar trend is registered by the young employed that have decreased less than the general figure. The participation of women in the labour market has increased at a high rate in the last years due to the low rates registered in 2003.

Figure 409. Trend in Female employment in Italy  
Figure 410. Female participation to labour market in Italy

Source: Eurostat

Indicators of social trust and openness of the country are shown in the following charts: the granting of citizenship has risen by 20% in the last 5 years and the crime registered have also increased by 4% from 2008.

Figure 411. Acquisition of Citizenship in Italy  
Figure 412. Trend in crimes recorded by the police in Italy

Source: Eurostat

Also the number of young people at risk of exclusion and poverty has increased after the beginning of the crisis. In the same period, the number of young school leavers has decreased.
The general trust indicator is high but, compared to other countries, the rate of individuals that claim to have strong familiar ties is slightly lower (83.8%). The number of both adults and young people that participate in voluntary activities and of those that participate in activities of charitable organizations is considerably high.

Source: Eurostat

In general, Italians show a high level of trust in society, and family is one of the strongest values.

Culture and Creativity

Despite the crisis the CCIs in Italy are increasing with the exception of last year, during which there is a halt in the contribution of CCIs to GDP, in general terms the sector has grown more than the general economy, reaching 1.56% of the GDP.

The above-mentioned process is not public driven. The following charts show the figures for public expenditure in culture and the trend in the public budget: the figures for CCIs stop growing in 2009.
Demand and Supply of Culture and Creativity

Italy has 4588 museums (7 every 100,000 inhabitants) and is the country with the highest number in the world of UNESCO cultural sites (46).

Table 44. Number of UNESCO cultural sites and museums in Italy

Still, cultural participation is not very high: 24,5% of the population claims visiting cultural sites (7,5% claims to repeat the experience more than 4 times per year); 41,3% goes to the cinema (9,3% more than 4 times per year); 27,5% attends live performances (8,3% more than 4 times per year).

Education

In Italy 23,4% of tertiary students are enrolled in culture-related studies. The most important number is in the Humanities (9,4% of total tertiary students); 6,8% are in Architecture and building, 5,2% in the Arts and 2% in Journalism and information. Except for Journalism and information, the other culture-related studies register a better trend than the general.
Employment and Young employment

The following charts show the trend of employed in the CCIs in relation to the general employment. Those employed in the CCIs represent 1.2% of the employed and young people represent 1%. The trend shows that professionals who work in the CCIs have a better performance rate than the rest, and this among both adults and young people.

Figure 421. Employment and young employment in Italy (Total and in CCIs)

Figure 422. Composition of Employed in CCIs on total employed in Italy

Source: Eurostat

The following charts show the composition of employment in the CCIs and its trend in the last 6 years. All those employed in the CCIs register a better performance than those employed in other sectors, in general. The employed in the “Creative arts and entertainment” and in “Libraries, archives and museums” (NACE 90 and 91) represent 0.64% of the total employed and, as shown, the trend in those sectors registers a very good performance. The only sector in which figures show a loss of jobs is, like in many other countries, the “Publishing activities” sector (NACE 58) that represents 0.33% of the total employed in the CCIs.

Figure 423. Trend in Employment in CCIs for sector of activity in Italy

Figure 424. Composition of employed in CCIs in Italy

Source: Eurostat

The general trend as regards employment of young people is shown in the following charts. In 2013 the young employed in the CCIs represented 0.9% of the total employed in this sector and the rate is growing fast from an initial 0.7% in 2008. The sectors with the largest number of jobs are the “Creative arts and entertainment” (NACE 90) and “Publishing activities” (NACE 58) while the other sectors represent less than 0.4% of the total employed in the CCIs.
In 2007 the growth of mobile phones registered a stop and, as the charts below seem to suggest, the mobile telephone market in Italy indeed has reached a level of saturation: in fact the number of new subscriptions per 100 inhabitants is 160 units. In the same 11 year period, fixed telephone subscriptions registered a decline of 8%; broadband reached 22.3% of the inhabitants and only 58.5% of individuals uses the Internet.

The employed in ICT represent 1.8% of the total labour force. The following charts show that the general trend is positive for the employed working in the “Computer programming” and “Information services” (NACE 62 and 63) sectors whereas it is negative for the “Telecommunications” sector (NACE 63). The highest number of those employed is registered in the “Computer programming” sector (NACE 62) with 1.1% of total employment; the “Information services” sector (NACE 63) is growing at a quite fast rate but represents only 0.3% of the total employed in the ICTs.
LATVIA

Latvia has been a member of the European Union since 2004. The total population of the country is 2.3 million. The trend in population is shown in the following charts: both labour force and population have decreased in the past 10 years and the same trend is followed by young people.

After a firm stop of GDP growth in 2009, with a figure 20% lower than that of 2008, the trend in GDP growth has changed and, at the end of the period analysed, is 10% higher than it was 2008. The economic growth of the country is not pushed by general public expenditure which, after the crisis, registered a cut of 7%.
The consequences of the crisis have befallen the employed: in 2008 employment fell by 20% and only after 2010 it has started to grow again. A similar trend is apparent for the self-employed who in 2013 have again registered figures as in 2008.

**Social environment**

The women employed in Latvia have faced the crisis with a better performance than their male counterparts. And, indeed, the gender representation in labour market is quite even with a little over 50% of the employed being women. Still, the young population performs worse than the adult population.
Acquisition of citizenship has strongly decreased in the past 10 years; only in the last year available an increase has been registered. In the same period the crime situation has improved.

Figure 439. Acquisition of Citizenship in Latvia

![Graph showing acquisition of citizenship in Latvia]

Source: Eurostat

The social condition of the young population is worse than it was 5 years ago and the risk of poverty has increased while school inclusion has improved.

Figure 441. Young people at risk of poverty or exclusion in Latvia

![Graph showing young people at risk of poverty or exclusion in Latvia]

Source: Eurostat

The social trust indicator is considerably high: 34% of adults participate in voluntary activities (31% of the young population) and family is a strong value for Latvians.

Culture and Creativity

In the last 5 years the performance of CCIs has not been positive. After a strong increase in the years before the crisis, in 2008 rates started to decrease reaching the levels of 2003. In the same way the contribution of CCIs to GDP has decreased and in 2010 it was at 1.65% of the general GDP.
The cultural sector has suffered deeply the effects of the crisis; in 2012 cultural expenditure was a 20% lower than in 2008 and public expenditure in culture dropped from 8.77% to 7.58%.

**Demand and Supply of Culture and Creativity**

In Latvia there are 2 UNESCO cultural sites and 141 museums (6.22 per inhabitant).

**Table 47. Number of UNESCO cultural sites and museums in Latvia**

**Education**

The charts below show that the number of students enrolled in culture-related subjects has increased in the last 10 years: they represent 15.2% of the tertiary student population (Chart.
In general though, after a period of increase between 2003 and 2008, the number of students in tertiary education has been decreasing steadily since 2009: in culture-related subjects the only to follow this general trend are the “Architecture and buildings” studies.

Figure 447. Trend in tertiary students in Latvia

Source: Eurostat

Employment and Young employment

The employment situation in the CCIs is shown in the following charts: in 2013 those employed in the CCIs represent 2.1% of the total employed and 2.4% are young people. The general trend in the CCIs is quite similar to that of general employment. Especially among adults, the chart shows a slight better performance of employment in the CCIs.

Figure 448. Tertiary students in Latvia

Source: Eurostat

The following charts show the employment trend in the CCIs compared with the general employment. The sector with the best performance is the “Creative arts and entertainment” sector (NACE 90) with 0.88% of the total population employed; the “Libraries, archives and museums” sector (NACE 91) represents 0.6% of the total employed and have a better performance that the general trend. The “Publishing activities” sector (NACE 58) has slightly decreased from an initial 0.42% of total employed to a final 0.35%; however, the trend registered is still better than the general one.

Figure 449. Employment and young employment in Latvia (Total and in CCIs)

Figure 450. Composition of Employed in CCIs on total employed in Latvia

Source: Eurostat
The lack of information makes it impossible to describe the situation for young people. The following charts only summarize the available data.

**ICT**

In 2013 over than 75% of the population used Internet and the number of mobile telephone subscriptions has increasing at a very fast rate from 2005. In the same period, the number of people with an access to broadband has reached 23% of the population whereas fixed telephone subscriptions have diminished.
Employment in the ICTs represents about 2% of the general employment. The lack of data, especially for the “Information services” sector (NACE 63) makes it difficult to identify a general trend. Still, it is possible to say that the “Telecommunications” sector (NACE 61) is growing while the “Computer programming” sector (NACE 62) is decreasing: these trends follow a different path than the one registered in Europe for the same sectors.

Lithuania is a Member State of the European Union since 2004. Its population is 3.3 million. The total population has decreased in the last decade by 7.5% and young people are decreasing faster than adults, with a loss of 16% over the same period. The labour force is slightly decreasing (-3.3%), but among young people the trend is more negative (-12.9%)
While the economic indicators are starting to grow again, the labour market, as shown in the charts below, is paying the consequences of the crisis: in the last 6 years employment fell by 10% (-21.5% among the young employed) and the self-employed have lost 6% (20% among the young employed).

**Social environment**

The figures of employment relating to women show a better trend than the ones related to general employment. Indeed, in Lithuania there is a strong participation of women who represent over 50% of the labour force. The following charts show the trend as regards young women: these register -19.1% from 2013 and are about are 43% of the total of the young employed.
Lithuania registers a decrease of citizenship acquisition since 2004 while the crime rate has increased in the last 3 years.

33.4% of young people are at risk of exclusion or poverty but the early school leavers have decreased by 6.3%.

The family trust indicator in Lithuania is very high and there is a high level of general trust in the country: 13.7% of adults declare to participate in voluntary activities (11.7% among the young) and 94.4% of the population trusts its closest relations.

Source: Eurostat

Culture and Creativity

The CCIs have, in the last 6 years, registered a negative trend: from 2003 the GDP in CCIs registered a growth of approximately 33% and, since 2008, it has just slightly decreased by about 4%. In the same way, the contribution to the general economy is now lower than it was in 2008 and the trend is negative. In 2011 the contribution of CCIs to GDP was 1.2%.

Figure 471. Trend of GDP in CCIs in Lithuania

![Figure 471](image)

Source: Eurostat

From 2008 public expenditure in culture has strongly decreased losing more than 25% of the budgetary allocation to culture: the total budget dedicated to culture is now at 4.1% of the general budget, 1.2% lower than it was in 2008.

Figure 473. Trend in public expenditure in Culture in Lithuania

![Figure 473](image)

Source: Eurostat

Demand and Supply of Culture and Creativity

The only data available to describe the cultural supply is the number of UNESCO cultural sites: in Lithuania there are 4. Participation in cultural life is strong for the performing arts sector and low for heritage.
Table 50. Number of UNESCO cultural sites in Lithuania

Education

In the last 10 years, despite the general trend by which the number of tertiary students is decreasing, education in culture-related subjects registers a growing trend. The highest number is that of students in Architecture and buildings (5.6% of the total student population) followed by students in the Humanities (4.1%) and in the Arts (3.5%). Students in Journalism and information are in the last position (1.5%) but have a faster growth rate than the other sectors.

Employment and Young employment

Due to the lack of information it is difficult to identify a trend as regards employment in the CCIs. The following charts show the lack of indicators for the general population.
In 2013, 22% of the population had access to broadband exceeding fixed telephone subscriptions and the number of mobile telephone per inhabitants was, instead, at 1,5; 68,5% of population used the Internet.

The following charts show that, due to the lack of data, also for the ICTs it is difficult to identify a general trend. Generally speaking it is possible to argue that employment in the “Telecommunications” sector (NACE 61) is decreasing and that in the “Computer programming” sector (NACE 62) it has grown until 2012 but is now decreasing. Employment in ICTs is about 1,3% of total employment although there is no available data for the “Information services” sector (NACE 63) and, consequently, the statement is relative.
**European Expert Network on Culture (EENC)**

Resilience of employment in the Culture and Creative Sectors (CCIs)

---

**Figure 481. Trend in ICT Employment in Lithuania**

**Figure 482. Composition of ICT Employment in Lithuania**

Source: Eurostat

---

**LUXEMBOURG**

Luxemburg was one of the founders of the European Union in 1952.

Its population in 2013 was 537,000 inhabitants with a growing trend for both adults and young people. The labour force is consequently growing, except for young people.

**Figure 483. Trend in population in Luxembourg**

**Figure 484. Trend in labour force in Luxembourg**

Source: Eurostat

The crisis has affected Luxemburg less than it has affected other countries: after a 2 year slight decrease, GDP is growing again and the differences between inhabitants is increasing the gap. In the same period the public expenditure has increased faster than GDP.
The crisis in Luxembourg has not affected employment: both for employed and self-employed the market is growing although for the young employment is growing at a slower rate.

Social environment

The participation of women in the labour market is at 44% (as regards young people it is impossible to identify a trend given the small statistical sample available).
While, as of 2008, the number of new citizens is growing faster than before, the number of recorded crimes has increased by 30%.

Source: Eurostat

The crisis has affected young people and the number of those at risk of poverty or exclusion is increasing although the education system seems to be effective because the dropout rate is diminishing.

Source: Eurostat

Society in Luxembourg is organized around strong family and closer relations ties. Indeed, it is possible to argue that people are generally generous and that general trust is high. People that participate in voluntary activities are 36.9% among adults and 30.8% among young people; in addition, 17% of individuals declare they participate in activities by charitable organizations.

</tr>
</tbody>
</table>

Source: Eurostat

The contribution of the CCIs to the general economy has grown in the last 6 years but in GDP percentage points it is quite stable: in 2012, the GDP in CCIs was 1.04%.
Culture and Creativity in Luxembourg

The same trend as that shown in the above charts is shown also in the ones below: whereas public expenditure in culture has grown since 2007, the percentage of public expenditure dedicated to culture has, over the same period, decreased.

Demand and Supply of Culture and Creativity

In Luxembourg there are 47 museums (7.8 per inhabitant) and one UNESCO cultural site.

<table>
<thead>
<tr>
<th>Description</th>
<th>Year</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNESCO cultural sites</td>
<td>2013</td>

</tr>
</tbody>
</table>

The population has an active cultural behaviour: 51.4% visit cultural sites (21.7% repeat the experience more than 4 times per year); 50.7% go to the cinema (30% more than 4 times per year) and 53% attend live performances (23.6% more than 4 times per year).
Employment and Young employment

Due to the lack of data, the trend in employment is difficult to describe: the following charts show the data available for adults and young people.

**Figure 499. Employment and young employment in Luxembourg (Total and in CCIs)**

**Figure 500. Composition of Employed in CCIs on total employed in Luxembourg**

Source: Eurostat

*A fortiori* the same problem of lack of data is registered for the single sectors in the CCIs.

**Figure 501. Trend in Employment in CCIs for sector of activity in Luxembourg**

**Figure 502. Composition of employed in CCIs in Luxembourg**

Source: Eurostat

**ICT**

93.8% of the population uses the Internet: the highest rate in Europe. The Luxembourgish have 140 mobile subscriptions per 100 inhabitants; broadband reaches 33% of the population and fixed telephone subscriptions are considerably high (50.5%) with respect to the European average.
Employment in the ICTs is growing faster than in other countries: the “Telecommunication” sector (NACE 61) is the largest sector in terms of the employed (1.6% in 2013) and has been stable in the last 6 years; the “Computer programming” sector (NACE 62) is growing faster than the “Telecommunication” sector and represents 1.2% of the total employed. Since the only available data is for in 2012 it is impossible to comment on the employment trends in the “Information services” sector (NACE 63).

Malta is an island of 420,000 inhabitants and a member of the European Union from 2004.

In the last 10 years, population is increasing and labour force is following the same trend. At the same time, the young population, and consequently the young labour force, are decreasing.
The crisis had a slight effect in Maltese economy. The GDP and the public expenditure had a recess in 2009 and then started to grow again in 2010. In the last 6 years, the GDP registered a growth of 20,5% and the public expenditure registered a 22,3%.

The economic crisis did not have a significant effect on the labour market, as both employment and self-employment have been increased after 2008: employment registered an increment of 9,6%, while self-employment registered a 11,5%.

Social environment
Like in many other countries, women’s employment is growing faster than the general figures. The trend in the last 10 years is diminishing the difference in the labour participation.
In 2013, females were 37.3% of total employed, compared to the 30.4% registered in 2003. The participation of young women in the labour market is also higher than adult women’s participation, as 46.6% of the total young employed are females.

**Figure 513. Trend in Female employment in Malta**

**Figure 514. Female participation to labour market in Malta**

Source: Eurostat

The islands are usually more open than the continental countries. The Maltese citizenship acquisitions are considerably increasing since 2006. On the other hand, from 2009 the criminal activity recorded has risen, after a period of decrease in 2007-2008.

**Figure 515. Acquisition of Citizenship in Luxembourg**

**Figure 516. Trend in crimes recorded by the police in Malta**

Source: Eurostat

The crisis has particularly affected the young population in Malta. The following data show that, within the same period, while the risk of poverty and exclusion is rising, the social policies on education are quite effective and consequently early leavers from school are diminishing.
Maltese people are very inclusive and 94,9% of them declare to trust in family and close friends. Besides, the participation to voluntary and charitable activities is more than 10,5% in youth and 12,2% among adults.

**Culture and Creativity**

The CCIs have strongly suffered the consequences of the economic crisis. The following figures expose that the contribution to GDP of CCIs is going down in the last 6 years and the growth of GDP from 2008 is stable. As it can be seen, total contribution of CCIs to general economy is 7,7%, which can be considered a very high rate.

Source: Eurostat

However, the public expenditure on culture is going up and it reached a 3,85% of general expenditure in 2013. This positive evolution is partly due to the fact that the sector is strongly supported by the government, especially after the economic crisis.
Demand and Supply of Culture and Creativity

Data on number of museums are not available and consequently the only indicator on cultural supply is the number of UNESCO cultural sites: 3 in Malta.

### Table 56. Number of UNESCO cultural sites in Malta

With respect to the demand, participation in cultural activities is not very high: 24,4% of individuals visit cultural sites and 20,3% attend live performances, but only around 5% of them do it more than 4 times per year. The cinema sector data are a bit higher, as 35,4% of individuals go to the cinema and 17,5% of them do it regularly.

Education

The following table shows the trend in tertiary students. While a very strong decreasing of students in Journalism and information is registered, there is a remarkable increment of the students in Humanities (8,7%) and Arts (4,6%), as the last group has risen faster than the general trend. However, within the last years, a strong recess is registered in every culture-related matter.
Employment and Young employment

A particularly fluctuating trend in employment on the CCIs for youth and adults is presented below. The employees in CCIs are currently 1.2% of total in the country. Among young people, the number of them involved in the CCIs sector is considerably variable in the last years.

Source: Eurostat

ICT

Around 70% of individuals use the Internet but only 32.8% have access to broadband. Fixed telephone subscriptions exceed 50% and the amount of individuals who use mobile phones is strongly increasing since 2003.
Employees in ICT represent 3% of total employed population, but there are not available data about “Information services” (NACE 63). The trend in data on “Telecommunication” (NACE 61) and “Computer programming” (NACE 62) are fluctuating. Telecommunication sector registered a fall from 2008, but the trend shows a slight increment within the last years. Computer programming, on the opposite situation, registered a growth during the same first period, but it is decreasing lately.

THE NETHERLANDS

The Netherlands, with 16,7 million inhabitants, is a founding member of the European Union (1952).

Its demographic trend is positive: population is growing, with a remarkable increase of youth in comparison to adults. The labour force is also enhancing, with a similar rate among adults and young people.
The economic indicators show that the crisis impact has not been particularly strong in the Netherlands, as the GDP is growing while the public budget is stable from 2010.

The employment rate is going down from 2008, but this trend is partially neutralized by the growth of self-employment. The self-employment trend is positive for both young and adults.

Social environment

Unlike many other countries, the women’s employment trend is negative both for the young and the adults. Women in the labour market represent a 46,4% of total employed, while there is an equal gender distribution in young people.
Despite the general progress, adult women have lost 1% of employment in the last 6 years, whereas the negative tendency is more visible among youth, with a loss of 5.7%.

Figure 539. Trend in Female employment in The Netherlands

Figure 540. Female participation to labour market in The Netherlands

Source: Eurostat

The granting of citizenship in the last 10 years has been fluctuant, registering an increase during the last 3 years. Within this period, the number of crimes recorded has decreased.

Figure 541. Acquisition of Citizenship in The Netherlands

Figure 542. Trend in crimes recorded by the police in The Netherlands

Source: Eurostat

Social policies adopted after the crisis seem to be effective: both the number of young people at risk of poverty and the number of early leavers from education are progressively being reduced.

Figure 543. Young people at risk of poverty or exclusion in The Netherlands

Figure 544. Early leavers from education and training in The Netherlands

Source: Eurostat
Trust indicator in society is very high: 97% of the population strongly entrusts close friends and family. More than half of the population, especially young people, participate in voluntary activities and a 31.6% of them collaborates with charitable organizations.

| Table 58. Other trust indicators in The Netherlands |
|----------------------------------|-------|
| Description                      | Age   | 2006 |
| Ability to ask any relative, friend or neighbour for help | 97    |

| Participation in informal voluntary activities Young    | 54    |
| Participation in activities of charitable organisations | 31,6  |

Source: Eurostat

Culture and Creativity
CCIs yield in the last 10 years has had a negative balance: while the GDP in CCIs is stable from 2007, in terms of contribution to the general GDP a negative direction is registered, falling from 1.7% to 1.5% in 10 years.

Source: Eurostat

The trend is confirmed by the negative evolution of public investment in culture: from a 6.4% to a 5.5% of total public expenditure. The CCIs seems to be strictly connected with the Cultural sector and to the public expenditure.

Source: Eurostat

Demand and Supply of Culture and Creativity
There are 788 museums (4.2 per 100.000 inhabitants) and 9 UNESCO cultural sites in The Netherlands.

Cultural demand is high: more than 50% of individuals regularly visit cultural sites, go to the cinema and attend live performances. The number of people repeating these cultural experiences throughout the year is elevated, being live performances (18.7%) and cultural sites visits (21.9%) the most repeated ones.

Education

Regarding tertiary education, students in culture-related matters in 2013 are below 12% and have slightly decreased from 2003. The data on Journalism and Information students are particularly significant due to the fall from 1.3% in 2003 to 0.6% in 2012. On the other side, students enrolled in Humanities are increasing and those in Arts and Architecture have remained stable for the last 10 years.

Employment and Young employment

Employment rate in CCIs was 1.8% in 2013 and it has been decreasing since 2008. The general trend in CCIs, both for the young and the adults, is negative when compared with the general employment data.
The more affected CCIs sectors by the economic crisis are: “Publishing activities” (NACE 58); “Libraries, Archives and museums” (NACE 91), traditionally funded by public expenditure; and “Motion picture, video and television programs production, sound recording and music publishing activities” (NACE 59), which maintain the same level as the registered in 2008. Unlike the rest, “Arts and entertainment” (NACE 90) evolution is increasing within the last years. There are not available historical data on “Programming and broadcasting” (NACE 60), as they represent a very small portion of the labour market: only 0.1% of total employment in 2013.

A negative trend is registered among the new generations, as all CCIs in 2013 are positioned in a low value in comparison with the general trend.
Figure 555. Trend in Employment in CCIs for sector of activity for young employed in The Netherlands

Figure 556. Composition of employed in CCIs for young employed in The Netherlands

Source: Eurostat

ICT
More than 90% of individuals use the Internet and 40% have access to broadband. The mobile subscriptions are 113 every 100 inhabitants, while fixed telephone subscriptions are diminishing in the last 10 years.

Figure 557. Fixed telephone, Mobile and broadband subscription per 100 inhabitants in The Netherlands

Figure 558. Percentage of Individuals using the Internet in The Netherlands

Source: Eurostat

Employment in ICT is dropping: in 2013, it is only 2.3% out of total employees in the country. The most relevant data belong to “Computer programming” (NACE 62), which is 1.8% of total employed. “Telecommunication” sector (NACE 61) is decreasing faster than others, and only “Information services” are increasing, even though they are a minority (0.1% in 2013) within ICT.
POLAND

Poland is a member of the European Union since 2004. 38.1 million people currently live in the country. The following charts show the trend of population in the last 10 years: while it is slightly increasing, the young population is diminishing, and consequently the labour market is following the same direction.

Source: Eurostat

After the crisis, the GDP had a recess in the biennium 2008-2009, but then registered a slow growth. On the other side, general public expenditure is stable from 2010.
The economic crisis has particularly affected the youth; the employment and self-employment among the adults had a slight decrease in the last 5 years, but the negative trend is much more visible for young people.

Social environment

Despite the positive tendency in other European countries, women's employment in Poland does not reach the expectations. The situation is even worse in 2013 than it was in 2008 and young female employment has especially suffered a strong fall in the last 2 years.
Data about the new citizenships acquired and the trend in criminal activities are positive: while the crime is decreasing in the last years, the acquisition of new citizenship is strongly increasing.

**Figure 569. Acquisition of Citizenship in Poland**

**Figure 570. Trend in crimes recorded by the police in Poland**

Source: Eurostat

The risk of poverty is dropping among the young population but the situation of early leavers from education is rising in the last years.

**Figure 571. Young people at risk of poverty or exclusion in Poland**

**Figure 572. Early leavers from education and training in Poland**

Source: Eurostat

The level of trust of Polish population is elevated: the 51,5% of adults and 51,7% of young declare to participate in voluntary activities and a 94,2% have a strong relationship with family and closer friends.

**Culture and Creativity**

The economic crisis has affected the CCIs: the following data show a 20% decrease of GDP in CCIs in the last 5 years. In addition, the contribution of CCIs in GDP is decreasing and was a 1,45% of the total GDP in 2011.
The trend in GDP is partially explained by the fact that public expenditure in culture has been reduced after the crisis: it was only 4.34% of total public budget in 2012.

The cultural participation is considerably lower than in other countries: 24.3% of the inhabitants attend live performances but only 5.6% of them repeat the experience more than 4 times per year. 37.1% go to the cinema (only 12.4% does it more than 4 times) and 31.3% visit cultural sites, from which only 8.5% of them repeat the activity.

**Table 63. Cultural behaviours in Poland**

Source: Eurostat
Education
The trend in tertiary students in culture-related matters is growing in the last decade. The students enrolled in Humanities are the most remarkable in numbers (6.7% of total students) but the rate is decreasing from 2008. The students in Architecture are increasing (from 2.7% in 2003 to 4.3% in 2012), as well as the students in Arts and in Journalism and Information, but they respectively represent only 1.6% and 1.2% out of the total in 2013.

Employment and Young employment
The employment trend have followed a different development path in the last 6 years among adults and young. The young employed in CCIs are facing the crisis in a better way than their colleagues employed in other sectors. On the other hand, the adults employed in CCIs are diminishing further more than the ones in other sectors. The number of employed in CCIs is 1.3% of total employment in 2013.

The following tables show the trend in employment in CCIs by sectors: in general, there is a negative balance registered for each sector, following the general trend. “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59) registers a positive trend, but it is only 0.11% of total employed. Publishing activities (NACE 58) have registered a remarkable negative trend by losing 19% in the past 6 years. “Creative arts and entertainment” (NACE 90) and “Libraries, archives and museums” are the most representative sectors (0.40% in 2013), both of them in decrease from 2009: first group has dropped a 4% while the second group dropped a 6% in the same period, but the trend is inverted in the last two years.
European Expert Network on Culture (EENC)

Resilience of employment in the Culture and Creative Sectors (CCIs)

Source: Eurostat

Among youth, the “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59), “Programming and broadcasting activities” (NACE 60) and “Creative, arts and entertainment activities” (NACE 90) sectors are registering a better balance, but the rest of them are considerably decreasing in comparison to the general trend.

Source: Eurostat

ICT

The number of mobile subscriptions is constantly going up within the last 11 years: while the fixed telephone subscriptions are 13.9 per 100 inhabitants, the mobile subscriptions are 150 per 100 inhabitants. In the same period, the access to broadband is 15.6% and 62.8% of total population uses the Internet.
The employment in the ICT sector registers a better performance than in the general labour market. The “Computer programming, consultancy and related activities” (NACE 62) is the largest sector (0.9% of total employment) and the only one that registered a negative trend in the last 6 years. “Telecommunications” (NACE 61) is the second largest one. The most dynamic sector is “Information services” (NACE 63), but it only represents 0.1% of total employment.

Source: Eurostat

Portugal is a member of European Union since 1986. The total population is 10.4 million and the general trend shown in the following figures is stable in the last 11 years, while the young population is decreasing a 21.8% from 2003.

Source: Eurostat
The crisis in Portugal had middle term effect. The growth has been recessed from 2008 and is significantly decreasing in the last two years. The public budget is strongly decreasing since 2010 and its position is lower in 2013 than it was in 2008.

The trend in employment presented in the following charts is negative both for employed and self-employed. The employed registered a loss of 13.2%, while the self-employed have lost a 21.4% since 2008. The situation of young people is even more worrying, as the trend of employed is very negative: -42.5% in the last 6 years, while the young self-employed have decreased a 16.2%, but either way their position is better compared to adults.
Social environment

While the employment situation is very negative, the trend is different among females: the women are losing 10.7% and as consequence, the females participation to the labour market is increasing in the last years reaching 47.5%. A similar trend is registered by the young women: they are losing a 30.1% (less than the general trend), and there are 46% of young women employed.

Figure 595. Trend in Female employment in Portugal

Figure 596. Female participation to labour market in Portugal

Source: Eurostat

From 2006, the acquisition of new citizenship is strongly increasing while the crime rate is decreasing during the same period.

Figure 597. Acquisition of Citizenship in Portugal*

Figure 598. Trend in crimes recorded by the police in Portugal

Source: Eurostat

*Estimated in 2007

Compared to other European countries, the crisis is strongly affecting the young population in Portugal, reaching a 28.4% risk of poverty or exclusion in 2013. On the other side, the social policies seem to be quite effective, as the rate of early leavers from education is improving.
Social cohesion is a strong asset in Portugal: 92.5% of individuals trust in family or closer friends and 28.4%, both young and adults, participate in voluntary activities.

Culture and Creativity

The following tables show the trend in GDP directly connected with CCIs. The general trend is stable from 2008 and the contribution of CCIs to the national GDP is slightly fluctuating from 0.84% in 2003 to 0.89% in 2009. In 2011, the last year with available data, GDP reached 0.87%.

The figures below show that public contribution in the CCIs is decreasing in the same period, especially from 2009. The public expenditure in culture in 2012 is lower than it was in 2003 and it has been losing about 25% since 2008. The national budget allocation dedicated to culture is decreasing since 2003 (4.04%), remaining only a 3.22% in 2012.
Demand and Supply of Culture and Creativity
There are 630 museums in Portugal (1,79 per 100,000 inhabitants) and 14 UNESCO cultural sites.

Education
The charts below present the trend in tertiary students in culture-related matters. The students in Arts and in Humanities are the only groups registering an increase from 2008. The students in Arts are 5,8% of total students and the ones in Humanities are 3,8%. The largest number of students in CCIs are the Architects (6,6% in 2013), but this data are decreasing from 2003. Students enrolled in Journalism represent a 1,9% in 2013, but this discipline has reduced its popularity in the last 10 years.
Employment and Young employment
The following data show the trend in employment in CCIs. Those employed in CCIs are 1.0%, both adults and young. The trend in the last 6 years is negative, but the individuals working in CCIs are in a better position than those working in other sectors.

The trend in CCIs employment is shown in the next graphic. All CCIs registered a better balance than the general trend: the employed in “Creative, arts and entertainment activities” (NACE 90) are losing 27%, “Publishing activities” (NACE 58) are registering a loss of 25% in the last 6 years, “Programming and broadcasting activities” (NACE 60) present a -19%. Two sectors are registering a positive trend: “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59), that reached a 0.2% of total employed in 2013, with an increase of 63%; and “Libraries, archives, museums and other cultural activities” (NACE 91) that reached in 2013 a 29% more than in 2008, although the sector data are diminishing since 2012.
The trend in employment in CCI sectors for young is not very clear due to the lack of data, especially in 2011. Balance of “Libraries, archives, museums and other cultural activities” (NACE 91), “Creative, arts and entertainment activities” (NACE 90) and “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59) is positive, while the other sectors are registering negative data compared to the general trend.

ICT

The crisis is significantly affecting the ICT sector in comparison with other European countries. Mobile subscriptions are 113 every 100 inhabitants, but fixed telephone subscriptions have increased its number in 2013 compared to 2003. In 2013, 23,8% of inhabitants have access to broadband and the rate of population using the Internet is 62,1%.
The employment in ICT is presented below. The lack of data for “Information service activities” (NACE 63) makes it difficult to have a complete scenario. As in many other European countries, the rate of employment in “Telecommunications” (NACE 61) is decreasing, while those employed in “Computer programming, consultancy and related activities” (NACE 62) are increasing. At the end of the period, both sectors represent a 0.7% of total employees.

Source: Eurostat

ROMANIA

Romania is a member of the European Union from 2007 but it does not belong to the Euro zone. The current population is 20.5 million people, but as it can be seen in the following graphics, the data have been reduced in the last 11 years, especially regarding young population, while the labour force is stable in the same period.
The economic crisis had a strong effect in Romania, especially from 2008 to 2012. It was not until 2013 that the GDP reached the same level as in 2008. The government expenditure had a recess from 2008, with an approximate loss of 10% in the last decade.

The employment is stable in the last years, having lost a 1.6% from 2008. The situation seems worse for the young population. In addition, a negative trend is registered about self-employment, with a loss of 5.2% since 2008.

Social environment
The situation for women in the labour market is similar to the general one. Females employed are 2.2% less than in 2008 and their participation in the labour market within the
last decade is decreasing. Women in 2013 represent a 44.5% of total employed, while they were 46% in 2003. Between young women, the rate is lower than the average: in 2013 young females employed are 40% of total young employed.

While the data on new citizenships is not available in the last 6 years, the number of crime registered is growing in the last year available.

The social policies seem to be ineffective due to the growth of young people at risk of poverty and the number of students dropping out of school early, which remains stable in the last few years.
The lack of data regarding trust indicators makes it difficult to accomplish a conclusion on the general situation in the country.

Culture and Creativity

While the trend in GDP is stagnant in the past years, the registered data about CCIs are increasing faster. Especially after 2009, the Contribution of CCIs to the general economy of the country registered a growth of 66.2% from 2008, while the contribution to the National GDP is 1.6%.

Figure 628. Trend of GDP in CCIs in Romania
Figure 629. Contribution of CCIs to the GDP in Romania

Source: Eurostat

CCIs are not significantly supported by the government. The expenditure in Culture is decreasing from 2007, following the general cuts in national budgets. In 2012, 2.77% of the total public expenditure is dedicated to culture.

Figure 630. Trend in public expenditure in Culture in Romania
Figure 631. Public cultural expenditure on total public expenditure in Romania

Source: Eurostat

Demand and Supply of Culture and Creativity

The only available data for Romania are the existence of 6 UNESCO cultural sites and 748 museums (3.34 per 100.000 inhabitants).

Table 67. Number of UNESCO cultural sites and museums in Romania

Education

The trend in tertiary education in culture-related matters is shown in the following figures. The students enrolled in Humanities and in Journalism and Information are decreasing more than the general trend, while the students in Arts and Architecture and buildings are increasing since 2007. The largest group of students belongs to Humanities (6.8% in 2013), followed by Architecture (3.7%) and Arts or Journalism (1.7%).

Employment and Young employment

The general trend in employment in CCIs is similar to the trend registered at national level. Those employed in CCIs are 0.7% of total employed (0.4% between young, which is decreasing faster than in other sectors). Due to the reduced number of employees in this sector, it is difficult to conclude if employment in CCIs in Romania is resilient or not.

The indicators below show the trend in the specific CCI sectors: The largest number of employees work in “Publishing activities” (NACE 58), that registered a positive trend in the last 6 years. Those employed in “Programming and broadcasting activities” (NACE 60) are decreasing from 2011 (they represent a 0.16% of total employed). “Creative, arts and entertainment activities” (NACE 90) has registered a more stable trend from 2008, while “Libraries, archives, museums and other cultural activities” (NACE 91) follow the same direction as the general one.
It is difficult to find an answer to the question for “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59) due to the lack of data and the reduced number of young employed.

**ICT**

The ICT sector is not significantly developed in Romania compared to other European countries. The number of mobile subscriptions are 105,6 every 100 inhabitants and the fixed telephone subscriptions remain stable in the last decade. The broadband reach is 17,3% and only 50% of individuals uses the Internet.

Employees in ICT represent 1.1% of total employed. Most of them (0.6%) are employed in “Telecommunications” (NACE 61), which is increasing in the last few years, while “Information service activities” (NACE 63) is registering a fast growth and “Computer programming, consultancy and related activities” (NACE 62) is slightly dropping.
Figure 640. Trend in ICT Employment in Romania  

![Trend in ICT Employment in Romania](image1)

Figure 641. Composition of ICT Employment in Romania  

![Composition of ICT Employment in Romania](image2)

Source: Eurostat

**SLOVAKIA**

Slovakia is a member of the European Union from 2004 and it belongs to the Schengen area since 2007. Its total population is 4.3 million inhabitants. This quantity has been growing in the last ten years, but young population is decreasing. Labour force follows the same pattern: total labour force is slightly growing, but among youth the rates are negative.

Figure 642. Trend in population in Slovakia  

![Trend in population in Slovakia](image3)

Source: Eurostat

Figure 643. Trend in labour force in Slovakia  

![Trend in labour force in Slovakia](image4)

Source: Eurostat

The position of Slovakia concerning the crisis is better than other European countries. After 2009, the economy started to grow, and in 2013 the GDP rose a 11.6%. A positive trend is also registered on general government expenditure, that has risen 24.1% from 2009.
While the general economy is growing in the past decade, the labour market is changing: after 2008 the employment has decreased (loss of 4.3%) but self-employment has increased (rise of 8.5%). The situation for young people is negative both for the employed and self-employed, in consonance with other European countries trend.

Social environment

The situation of female employment is shown below. Women involved in the labour market in 2013 are 3.3% less than they were in 2008 and their participation in labour market is slightly decreasing.
The new citizenship acquisitions have significantly decreased from 2007 and the crime rate is being reduced since 2009.

![Figure 650. Acquisition of Citizenship in Slovakia](image1)

![Figure 651. Trend in crimes recorded by the police in Slovakia](image2)

Source: Eurostat

The social policies for young people seem to be quite ineffective: while the risk of poverty and exclusion is growing in the last years, the rate of early leavers from education remains as it was in 2007.

![Figure 652. Young people at risk of poverty or exclusion in Slovakia](image3)

![Figure 653. Early leavers from education and training in Slovakia](image4)

Source: Eurostat

The general trust level of the population is high: 94,9% declare to have a strong familiar relationship and to trust closer friends. 31,6% of them participate in voluntary activities (28,3% among young) and 8,1% participate in activities related to charitable organizations.

**Culture and Creativity**

The CCIs in Slovakia are following the general positive trend. The GDP in CCIs is growing very fast after the crisis and its contribution to the general economy is stable.
In 2012, the public expenditure in culture was higher than in 2007, but after 2010 the situation is being inverted. The total cultural expenses in comparison with the general public expenditure is following the same trend: growing from 2007 to 2010 and decreasing during the last years. However, the long term tendency is negative: in 2003 the public cultural expenditure was 3% and in 2012 it has been reduced to 2,58% of total budget.

**Demand and Supply of Culture and Creativity**

There are 5 UNESCO cultural sites and 85 museums (1,39 per 100,000 inhabitants) in Slovakia.

Education

The trend in tertiary students in culture-related matters is positive. The following data show that the most relevant groups of students are enrolled in Humanities (5.4% in 2012) and in Architecture and buildings (4%), followed by the students in Arts (2.1%) and the ones in Journalism and Information (2.6%). In general terms, the number of students in culture-related matters is growing faster than in other sectors.

![Tertiary students in Slovakia](image)

Source: Eurostat

Employment and Young employment

The employment in CCIs is not very high: less than 1% of total employed is working in CCIs in Slovakia. The general trend is positive though, but from 2012 its direction is inverting.

![Employment and young employment in Slovakia](image)

Source: Eurostat

The lack of data among youth makes it difficult to obtain a reasoned conclusion, but in general terms, the following charts show that all CCIs sectors are growing faster than the general trend. The only exception would be the “Publishing activities” (NACE 58), which is decreasing more than the general trend in 2013. The lack of available indicators for “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59) does not allow to define the trend in this specific sector.
ICT
The number of mobile subscriptions in Slovakia are 113 per 100 inhabitants in 2013. After the beginning of the crisis in 2007, the trend is growing again, while the number of fixed telephone subscriptions is decreasing. 15.5% of inhabitants have access to the broadband and the population using Internet is about 78% (in 2013) and is steadily raising.

The employment in ICT is shown below: “Telecommunications” (NACE 61) are starting to register a negative trend from 2012, while “Computer programming, consultancy and related activities” (NACE 62) has registered the better performance in the sector. Available data on “Information service activities” (NACE 63) show a limited number of employees in the sector, with a stable trend in the last 4 years.
SLOVENIA

Slovenia has 2 million inhabitants, is a member of the European Union since 2004 and is part of the Schengen Area from 2007. The population is growing in the past decade but the labour force is decreasing due to the negative trend concerning the young population.

Source: Eurostat

The economic growth has remained negative since 2008, with a GDP loss of 4.6% in the last 6 years. In the same period, the public expenditure registered an increase of approximately 27%.

Source: Eurostat
Employment has diminished a 10% from 2008 and this decrease is around 40% among youth. A similar trend is registered on self-employed from 2010.

Social environment

The crisis impact is significant for women’s employment. Within the last decade, their situation is worse than the general state of employment, and as a consequence, participation of women in labour market is lower. The rate of adult women employed is 45.4%, while among young females the rate is 41.1%.
European Expert Network on Culture (EENC)

Resilience of employment in the Culture and Creative Sectors (CCIs)

Since 2006, there are more restricted policies about new citizenship acquisition and the figures are quite stable. At the same time, criminal activities recorded by the police are progressively rising.

**Figure 676. Acquisition of Citizenship in Slovenia**

**Figure 677. Trend in crimes recorded by the police in Slovenia**

Source: Eurostat

The social context for the young people in risk of poverty or exclusion is negative and the data are rising in the last 4 years. On the other hand, a positive evolution is registered regarding early leavers from school, as the rates are going down.

**Figure 678. Young people at risk of poverty or exclusion in Slovenia**

**Figure 679. Early leavers from education and training in Slovenia**

Source: Eurostat

The trust in relatives and friends among the Slovenians is very high: 95.1% have strong familiar relationships. Between 69.2% and 75.4% of population, especially young, participate in voluntary activities, although only 12.3% participates in charitable organisations activities.

**Table 71. Other trust indicators in Slovenia**

</tr>
</tbody>
</table>

Source: Eurostat

**Culture and Creativity**

The data on CCIs are quite negative in the last few years: GDP is decreasing around 2% and the contribution of the sector to the general economy is diminishing due to the growth in total GDP.
The following charts show the public expenditure in Culture. While the amount of public expenditure is decreasing in the last 3 years, after a period of growth from 2003 to 2010, the real impact of public budget on the cultural sector is stable in the first part of the past decade, but it is decreasing from 2010. These data highlight that public policies are progressively diminishing their commitment to the cultural sector.

Demand and Supply of Culture and Creativity

In Slovenia there are 2 UNESCO cultural sites and 177 museums, the equivalent of 7,78 museums per 100.000 inhabitants.

Less than 40% of the Slovenian population has built strong cultural habits: the rate of individuals attending live performances is 38,6% (15,9% attend more than 4 times a year), 30,9% of individuals go to cinema (among them, almost half of them 4 or more times a year) and 39,5% visit cultural sites (but only 12,4% repeat the experience on regular basis).

Source: Eurostat

**Education**

The number of tertiary students in culture-related matters is rising in the last decade. A more dynamic trend is registered by students in Arts: during 2013, their number has been doubled with respect to 2003. The largest number of students belongs to Humanities (6.2% in 2013) and Architecture and buildings studies (4.1% in 2013), followed by Journalism and information (0.7% of the total students). Except for Humanities, the number of students in other culture-related matters is increasing over the general trend.

**Employment and Young employment**

CCIs employment represents 2.3% of total employed (1.7% among youth in 2013). The following charts display that the general trend is negative: employment in CCIs is decreasing faster than the general trend both for adults and young, although it seems to be inverted and growing faster among adults in the last year.

The following graphics point out that the negative trend in CCIs employment is due to the negative performance of “Publishing activities” (NACE 58), while other sectors like “Libraries, archives, museums and other cultural activities” (NACE 91) are quite stable, or even increasing like the “Creative, arts and entertainment activities” sector (NACE 90). The number of employees in “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59) is limited (0.11% of total employed) and this is the reason why its data seem the most dynamic of all.
The lack of data in CCIs for youth makes impossible to give an overview of the trend in the last 6 years.

ICT

The charts below show the evolution of ICT in Slovenia. Like in many European countries, the number of mobile and broadband subscriptions are growing in the last decade, while the number of fixed telephone subscriptions are diminishing. The individuals using the Internet in 2013 are 72.7% versus 31.9% in 2003.

The rate of employment in the ICT is better than the general one: employment is growing especially on “Computer programming, consultancy and related activities” (NACE 62), with the largest number of ICT employees (1.3% in 2013). “Telecommunications” (NACE 61) employment is also growing in the last year, while the limited number of those in “Information service activities” (NACE 63) remains quite stable.
SPAIN

Spain is a member of European Union from 1986 and belongs to the Schengen area since 1991. The population has grown in the last decade and reached 45,8 millions of people in 2013. On the other hand, the young population is decreasing (around 10%) and the labour force is slightly increasing due to aging of population.

The economic crisis in Spain is stronger than in other countries. The GDP registered a fall of 6,7% in the last 6 years and the public budget policies are restricting the public expenditure, which remains stable since 2009.
The trends in employment and self-employment are negative: the employment rate registered a loss of 16.3% from 2008 (38.4% among youth) and self-employment lost 13% in the same period (43.3% among young people).

Social environment

The rate of women in the labour market is increasing, as the decrease rate is slower than the general one. This trend is registered for both young and adults: in 2013, adult women are 45.6% of total employed and young women represent a 47.6% of total employed.
After 2010, there is a recess regarding new acquisitions of citizenship that inverted the existent trend from 2003 to 2010. Within the same period, criminal activities recorded have also decreased.

The economic crisis is dramatically affecting the young population, but some social policies seem to be effective: the number of young at risk of exclusion is increasing, but the number of early leavers from the education system is going down.

The trust in the value of family is strong, as well as the trust in friends and other close relationships. The number of individuals that participate in voluntary activities is 45.1% (41.3% among young) and 11.3% are involved in charitable activities.

Culture and Creativity

Data on GDP in cultural and creative sector are available from 2003 to 2009, so obtaining conclusions about the trend in recent years is difficult. The following charts show the growth of GDP between 2003 and 2009, but in the same period the contribution to the national product was significantly fluctuating.
Regarding public expenditure, there is a dramatic cut in the budget dedicated to culture after 2009 (- 55,1% from 2008). This is one of the sectors that suffered one of the strongest budget resizing: from 6,63% of the total budget in 2008, to 2,73% in 2013.

**Demand and Supply of Culture and Creativity**

In Spain there are 41 UNESCO cultural sites and 1479 museums (2,88 per 100,000 inhabitants).

**Table 75. Number of UNESCO cultural sites and museums in Spain**

Education

The following data show the trend in tertiary student choices: only the number of Art students is growing faster than the general trend (5.5% in 2012 versus 4.1% in 2003), whereas all the other culture-related matters are growing slower. The students in Arts and in Humanities represent 11% of total students, followed by the students in Architecture (5.2%) and those in Journalism and information (1.5%).

Education

Employment and Young employment

The employment in CCIs in Spain is 1.3% of total employment and has been quite stable for the last 6 years. The general trend is weak, but in CCIs the evolution is worse than in the other sectors.

Employment and Young employment

This negative trend is due to the evolution of the main sectors of activity: “Publishing activities” (NACE 58) and “Programming and broadcasting activities” (NACE 60) are the two sectors losing the largest number of employees, while “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59), “Creative, arts and entertainment activities” (NACE 90) and “Libraries, archives, museums and other cultural activities” (NACE 91) are decreasing less than the general trend.
A similar tendency can be observed in young employment: a negative balance is registered for every sector of activity, but “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59) and “Libraries, archives, museums and other cultural activities” (NACE 91) seem to have a better evolution compared to other disciplines.

**ICT**

The following charts show the trend in ICT sector. 70% of Spaniards have access to the Internet (40% in 2003) and the broadband is reaching 25% of inhabitants in 2013. Mobile subscriptions grew from 2003 to 2011, but they are starting to decrease, while fixed telephone subscriptions are stable, with a loss of 2% in 11 years.
Those employed in ICT are 2.3% of total employed in 2013. The trend in ICT employment is displayed in the following charts: the “Computer programming, consultancy and related activities” (NACE 62) is the only sector that despite the economic crisis keeps growing in the last years, while “Telecommunications” (NACE 61) and “Information service activities” (NACE 63) are decreasing since 2008, although there is a slightly inverse trend in the last biennium.

Source: Eurostat

SWEDEN

Sweden became a member of the European Union in 1995 and is part of the Schengen area since 1996. It has a population of 9.2 million of people and the trend, shown in the following tables, is positive both for adult and young, as well as the labour force is increasing.
The crisis in Sweden was especially strong from 2008, with a negative peak registered in 2009. After this period, the GDP is growing faster and the public expenditure is accompanying this trend.

The employment is rising in the last decade, both for young and adults, and so is self-employment, although a more positive trend is registered among the young.

Social environment
The participation of women in the labour market is 47.6% in 2012 but is slightly decreasing from 2003. The number of females employed is growing slower than the general trend, but in 2013 the number of young women in the labour market is the same as men.
In the last decade, the number of new acquired citizenships in Sweden followed a fluctuating trend: it decreased after 2007 and has progressively grown until reaching 64.7% in 2013. From 2007, the crime records are growing, becoming one of the highest in Europe.

The risk of poverty between young people is decreasing from 2010 and so is the number of students early dropping out of the educational system.

The trust in family and closer friends is high: 96.6% of individuals declare to have a strong trust in close relationships; the trust in the private institutions is also high: 36.3% of adults
are involved in voluntary activities (34.8% among young) and 11.7% participate in charitable organizations activities.

**Education**

Students in culture-related matters are growing faster than students in other matters: the largest groups in 2013 are registered in Humanities (9.1%) and in Arts (4.3%). The first group is increasing and the second one is following the general trend. Architects are growing from 2.6% in 2003 to 3.6% in 2013 and a similar direction is followed by Journalists, although they are the smallest group (2.1% in 2013).

**Employment and Young employment**

The employees in CCIs are 2.3% of total employed in 2013 (2% among young) and are decreasing faster than in the total labour market. Unfortunately, both for adults and young, the trend is lower than in other sectors.
The situation in the different sectors is displayed in the following charts: those employed in “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59) represent 0.31% of the population, but numbers are growing faster than the other sectors; “Creative, arts and entertainment activities” (NACE 90) represent 0.65% and have a better evolution than the national average; “Programming and broadcasting activities” (NACE 60) are a minority (0.16%) but have a positive trend from 2008. On the other hand, most employees in CCIs belong to “Publishing activities” (NACE 58) but this sector is following a negative evolution (from 0.89% in 2008 to 0.74% in 2013), and “Libraries, archives, museums and other cultural activities” (NACE 91) which is also decreasing faster than the average.

The statistical sample of young employees gives an unclear vision of the general trend among youth. The only sector that seems to have a negative trend is “Publishing activities” (NACE 58), while the other ones have a fluctuating trend in the past 6 years due to the lack of available data.

ICT

Around 95% of Swedish people use the Internet and 32% of inhabitants have access to broadband. The mobile subscriptions are increasing (124.4 every 100 inhabitants) whereas fixed telephone subscriptions are decreasing (from 64.6% in 2003 to 40.4% in 2013).
The employment in ICT is growing faster than in other sectors: this is caused by the growth of employment in “Computer programming, consultancy and related activities” (NACE 62), which is 2,2% in 2013 (it was 1,9% in 2008). The employees in “Telecommunications” (NACE 61) and in “Information service activities” (NACE 63) are a minority but have remained stable in the last years.

Source: Eurostat

The United Kingdom is member of European Union since 1973 but it is not in the Schengen area or in the Euro area.

The population in 2013 is 61,7 million and in the last decade this number is growing, as well as it is the labour force. The number of young population is going up slower than the total population and in the labour market they are significantly decreasing from 2008.
The financial crisis has strongly affected the United Kingdom. From 2007 to 2009, there is a negative trend in GDP and in the following years it came back to the same level of 2008. The negative effect on domestic product has influenced the public expenditure, that has remained stable for the last 6 years.

While the economy indicators are negative, the effect of the crisis seems not to affect the employment, as along with self-employment, both are increasing after 2008. A negative trend is only registered between young people.
Social environment

The position of women in the labour market is improving during the last decade: the tendency in employment is positive and the percentage of women employed is 46.5% (among young it is 49%).

Source: Eurostat

The number of new acquired citizenships has risen from 2008, while the crime is decreasing in the last 6 years.

Source: Eurostat

The risk of poverty for young is increasing but the social policies to include them in the education process seem to be effective, as the number of early leavers from school is remarkably going down.
There are not available data on voluntary activities in United Kingdom, and in general terms there is not a strong family trust. United Kingdom has the lower rate in Europe for this indicator and the trust in institutions is also low, reaching only 8.2%.

Culture and Creativity

The Cultural and Creative sector registered a negative trend in the last years: while the contribution to GDP is decreasing, reaching 2.5% in 2011 from 2.95% in 2003, the GDP in CCIs remains stable from 2010.

The negative trend is confirmed by the following data: the public expenditure in culture from 2007 is falling in comparison with the total budget.
Demand and Supply of Culture and Creativity

In United Kingdom there are 24 UNESCO cultural sites and 1732 museums: 2,4 per 100,000 inhabitants.

Education

The tertiary students in Culture-related matters are 21,7% of total tertiary students and the rates are growing in the last decade. The number of students enrolled in Art is growing faster than the general trend. Humanities students are decreasing whereas Architects and Journalists are increasing.
Employment and Young employment

The trend in employment in CCIs is described by the following data: the percentage of employees in CCIs is 2.1% (2% among young). As it can be seen in the charts, the evolution is positive for young but negative for adults.

Source: Eurostat

Looking at the sectorial data, the only sector that registers a positive trend is “Programming and broadcasting activities” (NACE 60) (0.26% of total employment), while the other sectors are decreasing faster than the general trend. From 2011, the direction seems to be inverted especially for those employed in “Creative, arts and entertainment activities” (NACE 90) and “Motion picture, video and television program production, sound recording and music publishing activities” (NACE 59). On the other hand, a negative trend is registered by “Publishing activities” (NACE 58) and “Libraries, archives, museums and other cultural activities” (NACE 91).

The charts below show the trend in employment per sector amount the young population: the only sector decreasing is “Creative, arts and entertainment activities” (NACE 90), while the other sectors are growing faster than the general trend.

ICT

90% of inhabitants uses the Internet in United Kingdom (they were 65,6% in 2003); the mobile subscriptions are 123,8 every 100 inhabitants and the broadband reaches almost 36% of the population. The fixed telephone subscriptions are decreasing: in 2013, only 52,9% of inhabitants have a fixed telephone contract.

Source: Eurostat

The ICT sector faced the impact of the crisis from 2008 to 2012. The following data show the trend in employment in United Kingdom: only “Computer programming, consultancy and related activities” (NACE 62) sector is improving, with a 2% of total population employed in 2013. The other sectors are decreasing within the same period. In the last two years, “Telecommunications” (NACE 61) seems to be inverting the negative trend, but it is only 0,6% out of the total employed in the country.

Opinions and interviews

To collect opinions among the OMC group a web interview was carried out. The interview is available at [http://www.eccom.it/limesurvey/index.php?sid=62975&lang=en](http://www.eccom.it/limesurvey/index.php?sid=62975&lang=en) (Token: DGEAC)

Recipients: members of the OMC group on export strategies for the CCIs. Following the suggestions of DGEAC the interview has been sent to:

Michele Trimarchi, Emilio Cabasino, Michael Soendermann, Mike Coyne, Hassan Bakhshi, Cristina Da Milano.

The interview is divided in 3 parts, as follows:

- **Part one (Creative labour market)**
  - The labour market in your country
  - Flexibility of working contracts
  - Training in cultural and creative sector
  - Availability of cultural statistics
- **Part two (App economy)**
  - Digital agenda in your country
  - Priorities in digital policies
  - Public and private investments in digital companies (R&D, etc)
- **Part Three (Best and worst practice)**
  - A list of best practice in cultural and creative sector
  - A list of worst practice in cultural and creative sector
  - A list of best practice in digital sector
  - A list of worst practice in digital sector
Problems, ideas, guidelines

This study has collected data from Eurostat in order to exploit comparable figures to understand the dynamics in the labour market and, in particular, in the CCIs and ICTs.

The underlying assumption was, as stated in the introduction and first part of this report, that that employment in cultural and creative sectors is resilient and, in order to assess whether this assumption is correct, it was decided to analyse available data as regards the labour market and to complement it with further statistical information to provide for as comprehensive a scenario as possible.

Culture and creativity and are “labels” that encompass different realities depending on the country and the development of the CCIs and the ICTs can be the result of different national policies. Moreover, the statistical framework available is often shaped at national level while policies for the CCIs are mostly designed at local level. Whereas it can be quite difficult to demonstrate that at national level employment in the CCIs is resilient this can be, on the contrary, demonstrated quite easily at local level. Indeed, many case histories have been studied at small scale (neighbourhoods, small areas in a city, etc.) and many of the reports that try to underline the importance of the CCIs in the general economy of a country analyse, to this end, realities in towns or portions of cities.

The present study can only give an overview picture of the general situation of the labour market in the CCIs and this also in relation with the general environment (social, economic and cultural).

The cultural and creative sector is often organized in clusters. An extensive analysis of the labour market at country level can only give a general trend which, moreover, might not be accurate since the cultural creative sector flourishes especially in smaller areas and has spill-over effects in many other areas (crime, health, etc.).

The labour force survey (LFS) can give a general trend at both national and international levels but suffers of the statistical limits proper of a survey. Another limit to the analysis carried out is that the sections of data available are small: the CCIs as the ICTs account for approximately only about 2% of the total population of a given country and, in the case of young people, the portion analysed often represents only a few thousands of units in a one given country. Indeed, there are only a very small number of cases on which to base initial considerations which in no way can be considered as final and comprehensive. In general terms, there is a strong risk of working with data which is incomplete and, in many countries, the small numbers available for the past years cannot provide for the identification of a correct trend. Consequently, this study can be a first step in the analysis of the CCIs and ICTs in order to identify which are the most relevant areas in Europe on which to focus further research and structure different ad-hoc analyses.

Another factor that has to be taken into consideration is that Member States in the EU have different labour market and fiscal regulations. The following chart highlights the difference between gross and net salary in the different EU Member States. The total cost of work can indeed have a strong impact on the development of employment but, on the other hand, the level of public services for the labour market can be more or less effective in the different EU Member States.
The crisis has had a very strong effect in many Member States and this general trend implies that both in the CCIs and ICTs there have been different development paths that have depended upon many diverse factors.

Overall, the resilience of the labour market is the consequence of a range of public policies. In the present study the general environment and the specific context of the labour market in the different EU Member States has been described and this with the aim of having the highest number of factors that play a role in the development of the CCIs and the ICTs.

The diversity of the available data and the differing situations do not allow to draw a single, general conclusion: in many Member States there is a strong tradition in the CCIs that can explain the reason why the sector is more resilient whereas in others it is only possible to say that policies in support of the cultural and creative sector are only at the beginning and that the effects will be visible only in the future.

The following matrix affords a summary of the different aspects that can have a role in the development of the CCIs and ICTs and tries to characterize the different positions of the individual European Member States. It has been worked out on the basis of the rank orders of the indicators, taking the maximum level of each indicator and dividing it in 3 levels: the higher class is indicated with a “+” sign, the medium with a “=” sign and the lower with a “-” sign. The aggregated indicator (total) is calculated by adding the number of signs and weighing the different results with their relative importance: + equals 3 points; = equals 2 points and – equals 1 point while n/a equals 0 points.
As the table above shows in 16 countries there is a positive indicator as regards the resilience of adult employment in the CCI labour market and in 15 countries there is a positive indicator as regards the employment of young people: consequently, it is possible to affirm that, in the majority of the EU Member States, the labour market in the CCI is indeed resilient.

The table also clearly evidences that focusing on the different results of the indicators there is a very strong variety of combinations.

There is a group of Member States in which a positive value for the total indicator is not followed by a positive indicator in the cultural and creative sector’s labour market, and this for both young and adults. These Member States are Denmark, Germany, the Netherlands, Slovenia and Sweden.

There is another group of Member States in which a negative value for the total indicator is connected to 2 positive indicators as regards the resilience in the labour market of the CCI.

---

3 For Luxemburg and Lithuania it is, nevertheless, impossible to provide a definite answer.
both for adults and young. These Member States are the Czech Republic, Ireland, Italy, Malta and Portugal.

In 10 Member States (Belgium, Czech Republic, Estonia, Finland, France, Greece, Ireland, Italy, Malta and Portugal) there is a positive result for the resilience in the labour market both for young and adults and in 6 Member States (Denmark, Germany, The Netherlands, Slovenia, Spain and Sweden) there is a negative result for both. It is important to underline that in these 6 Member States there is a high percentage of employed in CCIs and this might be the reason why employment in the sectors has not proven resilient.

In 5 Member States (Austria, Croatia, Cyprus, Romania, Slovakia) there is a negative result for the young but a positive one for adults and in 4 Member States (Bulgaria, Hungary, Poland, United Kingdom) the inverse situation is present.

As regards other Member States is has been impossible to arrive to any definite result: in Croatia or Romania the lack of data for many indicators cannot give a clear answer and in some other Member States there is no complete set of indicators available. This fact points on the importance of having quality data collected and harmonised in all the European Member States in order to enable for a correct analysis of the political, social and economic policies needed to develop a strategy to strengthen the CCIs and to multiply their impact in the economy.

On the basis of the analysis carried out so far and with the data available it is, nevertheless, possible to say that the development of the CCIs follows different paths and that a positive or negative result at Member State level can be connected with other factors like tradition, innovation, skills, technologies, etc.

The very wide range of Member States, the different situations registered in each in terms of development, public services, productive systems, etc. cannot give a clear cut answer to the initial question regarding the resilience of the labour market in the CCIs and cannot give evidence of the paths that need to be followed to reach the goal of a strong development of the CCIs.

Final considerations, remarks and guidelines

- As shown throughout the study the work force employed in the CCIs represents a very small part of the total work force: indeed, those employed in the CCIs represent approximately 2% of the total work force. The Labour Force Survey (LFS) is carried out through a sample of the total work force and, although the resulting trends can be considered as general, when specific segments of data (be it per country or sector) are analysed trends appear as less significant. Consequently, when alterations happen on small numbers and are applied to percentages they appear to be more relevant than what they should.
- As most studies show, women represent the highest percentage of those employed in the cultural sector, in general, but also in the CCIs. When the “resilience” factor appears in employment the obvious question is whether it is the sector, be it the cultural sector of the CCIs, which is resilient or whether it is rather women that, in more general terms, are more resilient.
- Most of those employed in the CCIs are either employed in small companies (SMEs) or self-employed. When analysing self-employment it appears that it covers a very wide diversity of professions, ranging from culture and the arts to amusement activities, betting
and gambling or sport. Therefore, available data does not allow for a correct identification of trends as regards self-employment in the CCIs.

- The different European countries show diverse situations which make it difficult to compare larger countries such as Germany, France or Italy with smaller ones such as Estonia, Luxemburg, Malta, etc. Moreover, in some cases the overall population of a given country is lower than that of regions or cities in another: for example, the total population of Croatia is equivalent to 50% of the population of London. Thus, analysis should be eventually carried out at different territorial levels, depending on the situation.
- In fact, in some cases the analysis of the CCIs appears to be better focused if carried out within smaller territories rather than at country level especially in the cases of larger countries where it is difficult to identify micro data and, consequently, identify development trends.
- Public policies geared to foster culture and creativity appear to have a stronger impact at infra-state level, in more limited territories (as is the case of the creative clusters). Although this study provides for a macro analysis it, nevertheless, enables for the identification of the criteria to determine what are the most relevant environments where culture and creativity can flourish.
- As stated on several occasions in the study, culture and creativity flourish in territorial “clusters” albeit in specific countries. Conversely, these clusters have direct or indirect spill-over effects on other sectors, industrial or not, and also beyond the specific territory where they are located. This shows that although this study has applied the “from general to particular” approach, the reverse approach might prove to provide interesting results.
- In a period when public and private budgets decrease it is important that public policies aim at fostering both cultural participation and consumption of cultural goods and services in order to boost the development of the cultural and creative sectors through direct market revenue.
- Finally, regulating the labour markets can have a strong impact on the development of the cultural and creative sectors.

Therefore there is further scope to:

- Identify creative clusters where to carry out specific research in order to provide policy makers with a more detailed dimension of the phenomenon. In this sense, it might be interesting to focus research on medium-sized cities (or on specific areas of larger-sized cities).
- Include social indicators in the analysis of the cultural and creative sectors since they provide for a good approximation to the creative environment.
- Collect, in the coming years, a data set to track the development of the cultural and creative sectors and emphasize the different development trends at different territorial levels.
- Make available both quality open-data in the cultural and creative sectors as well as the existing research on the impact of cultural and creative policies since this provides very useful tools for all those professionals wanting to operate in the sector.
- Stimulate transparency as regards public funding, both at national and local levels, for the cultural and creative sectors not only as concerns its end-results but, rather, as regards the overall process leading to the granting of funds. This enables for a sense of ownership built on trust from the cultural professionals as well as from civil society at large. Ultimately, it fosters the development of the sector itself.
- Identify, in detail, the parameters and categories that define both cultural and creative professionals as well as the cultural and creative sectors.
Bibliography and sources of information

The analysis is started with a mapping of the literature in the field of creative economy and statistics. From the suggestions of the DG EAC, the preliminary study started from the analysis of the literature in the field of Creativity and statistics. We have extended the number of studies to documents and analyses as listed below:

- Creative industries for youth: unleashing potential and growth (UNIDO 2013);
- Cultural statistics pocketbook (Eurostat 2011);
- ESSnet Culture – European Statistical System Network on Culture’s Final Report 2012
- The Economy of Culture in Europe (KEA 2006)
- Communication from the European Commission on Promoting cultural and creative sectors for growth and jobs in the EU (EC 2012)
- Cultural statistics in the spotlight (Eurostat 2011)
- Special Eurobarometer 399 – Cultural Access and Participation Report 2013
- La diversité des emplois créatifs: une richesse pour l'Ile-de-France (IAU 2011)
- La spesa pubblica in Europa 2000-2013 (Ministero dell'Economia e delle Finanze – Ragioneria generale dello Stato, 2014)
- Promoting Investment in the Cultural and Creative Sector (KEA 2010)
- The Good practice report of the Open Method of Coordination Working Group on Cultural and Creative Sectors’ Export and Internationalization Support Strategies (2014)
- Un avenir plein de promesses dans le secteur des TIC pour une nouvelle génération de femmes (ITU 2012);
- Indicators of social capital in the European Union, Working Paper IAREG 2008/02
- Compendium on Cultural Policies and Trends in Europe” website
- DG EAC’s website
- OMC members interviews

Data collection

Data are mainly collected from official sources. The following list of sources summarizes the data used.

- RGS "La spesa pubblica in Europa: anni 2000-2012"
- Eurostat
- UNESCO
- EGMUS
- EU-SILC - ad hoc module 2006
- ITU - International Telecommunication Union
